SAFETY INFORMATION

This section contains important safety information related to general use of the TRANQUILITY II Patient Monitor. Other important safety information appears throughout the manual in sections that relate specifically to the precautionary information. Read all text surrounding all precautionary information.

The TRANQUILITY II can be powered by one internal battery that provides 2 hours of monitoring from fully charged batteries. The batteries are continuously recharged when AC power is connected to the monitor.

A warning message appears on the screen and an audible alarm sounds when the remaining battery power is only enough for 15 minutes of operation. The user should connect the monitor to an external power source to avoid loss of patient monitoring action. External power sources may be connected, disconnected, and reconnected without interrupting the monitoring action.

[NOTE]: Before use, please read this manual carefully.

[WARNING]: The TRANQUILITY II is defibrillator proof. It may remain attached to the patient during defibrillation or while an electrosurgical unit is in use, but the readings may be inaccurate during use and shortly thereafter.

[WARNING]: The TRANQUILITY II Patient Monitor is a prescription device and is to be operated by qualified personnel only.

[WARNING]: Occasionally, electrical signals at the heart do not produce a peripheral pulse. If a patient's beat-to-beat pulse amplitude varies significantly (for example, pulsus alternans, atrial fibrillation, rapid-cycling artificial ventilator), blood pressure and pulse rate readings can be erratic and an alternate measuring method should be used for confirmation.

[WARNING]: Explosion hazard. DO NOT use the TRANQUILITY II in the presence of flammable anesthetics or gases.

[WARNING]: DO NOT lift the monitor by the sensor cable, blood pressure hose, or power cord because the cable, lead, or cord could disconnect from the monitor, causing the monitor to drop on the patient.

[WARNING]: The TRANQUILITY II may not operate effectively on patients who are experiencing convulsions or tremors.

[WARNING]: Disconnect the TRANQUILITY II and sensors during magnetic resonance imaging (MRI) scanning. Use during MRI could cause burns or adversely affect the MRI image or the monitor's accuracy. Also, to avoid burns, remove the sensors from the patient before conducting MRI.

[WARNING]: The user must check the equipment prior to use and ensure its safe and proper use.

[WARNING]: To ensure that the leakage current protection remains within the specifications, use only the patient cables supplied with, or specifically intended for use with the TRANQUILITY II Monitors.

[WARNING]: To ensure patient safety, DO NOT place the monitor in any position that might cause it to fall on the patient.

[WARNING]: For pacemaker patients, the TRANQUILITY II may continue to count pacemaker rate during occurrences of cardiac arrest or some arrhythmias. To reduce the likelihood of this, ensure that the Pacer Detect setting is ON in the ECG menu when monitoring such patients. DO NOT rely entirely upon the TRANQUILITY II alarms. Keep pacemaker patients under close surveillance.

[WARNING]: Connection of non-isolated devices to the RS-232 connector may cause chassis leakage to exceed the specification standards.

[WARNING]: Enclosure leakage current is less than 100 microamperes (μ A); however, always consider additional leakage current that can be caused by other equipment used on the patient at the same time as these monitors.

[WARNING]: DO NOT autoclave, ethylene oxide sterilize, or immerse these monitors in liquid. Unplug the monitors before cleaning or disinfecting.

[WARNING]: DO NOT use the TRANQUILITY II to monitor patients who are linked to heart/lung machines.

[WARNING]: To prevent electrical hazards to all personnel, these monitors must be properly grounded. The chassis grounding assembly, Universal Switching Power Supply, and the power cord supplied with the equipment provides for this protection. DO NOT attempt to defeat this protection by modifying the cords or using ungrounded adapters.

[WARNING]: It is possible for the patient to receive a burn due to an improperly connected electrosurgical unit. Additionally, the monitor could be damaged or measurement errors could occur. Certain steps can be taken to mitigate against this problem, such as not using small ECG electrodes, selecting ECG electrode sites remote from the expected RF paths, using large electrosurgical return electrodes, and verifying that the electrosurgical return electrode is properly attached to the patient.

[WARNING]: ECG cables may be damaged if they are connected to a patient during defibrillation. Cables that have been connected to a patient during defibrillation should be checked for functionality before using again.

[WARNING]: Line isolation monitor transients may resemble actual cardiac waveforms and thus inhibit heart rate alarms. Such transients may be minimized by proper electrode and cable placement, as specified in this manual and electrode directions for use.

[WARNING]:

Defibrillation and Electrosurgery: DO NOT touch the patient, or table, or instruments, during defibrillation.

After defibrillation, the screen display recovers within 10 seconds if the correct electrodes are used and applied in accordance with the manufacturer's instructions.

ECG cables can be damaged when connected to a patient during defibrillation. Check cables for functionality before using them again.

According to AAMI specifications the peak of the synchronized defibrillator discharge should be delivered within 60 ms of the peak of the R wave. The signal at the ECG output on the TRANQUILITY II patient monitors is delayed by a maximum of 30 ms. Your biomedical engineer should verify that your ECG/Defibrillator combination does not exceed the recommended maximum delay of 60 ms.

When using electrosurgical (ES) equipment, never place ECG electrodes near to the grounding plate of the ES device, as this can cause a lot of interference on the ECG signal.

[Caution]: When connecting the TRANQUILITY II to any instrument, verify proper operation before clinical use. Both the TRANQUILITY II and the instrument connected to it must be connected to a grounded outlet. Accessory equipments connected to this Patient Monitor must be certified according to the respective IEC standards (e.g. IEC 60950 for information technology equipment and IEC 60601-1 for medical electrical equipment). Furthermore all configurations shall comply with the valid version of the system standard IEC 60601-1-1.

Any person who connects additional equipment to the signal input or signal output is responsible to ensure the system complies with the requirements of the valid version of the system standard IEC 60601-1-1. If you have any questions, please be free to contact our company or customer service. in doubt, contact our company or customer service.

To ensure accurate readings, consider the environmental conditions that are present and the condition of the patient. See the appropriate sections of the manual for specific safety information related to these conditions.

INTRODUCTION

- INTENDED USE
- ABOUT THIS MANUAL

INTENDED USE

The TRANQUILITY II Patient Monitor is a comprehensive monitoring system with eight traces compiling, processing, analyzing and displaying data from up to nine different patient parameters. It integrates parameter measuring modules, display and printer in one device, featuring in compactness, lightweight and portability. Built-in battery facilitates transportation of patient.

The purpose and function of the TRANQUILITY II Patient Monitor is to monitor ECG, heart rate, NIBP (systolic, diastolic, and mean arterial pressures), SpO_2 , respiration, dual temperature, $EtCO_2$, dual IBP, anesthetic gas (AG) for adult, neonate and pediatric patients in all hospital areas and hospital-type facilities. It may be used during hospital transport and in mobile, land-based environments, such as ambulances.

WARNING: The TRANQUILITY II Patient Monitor is intended only as an adjunct in patient assessment. It must be used in conjunction with clinical signs and symptoms.

ABOUT THIS MANUAL

This manual explains how to set up and use the TRANQUILITY II Patient Monitor. Important safety information relating to general use of the TRANQUILITY II appears before this introduction. Other important safety information is located throughout the text where applicable. **Read the entire manual including the Safety Information section before you operate the monitor.**

Ţ	Fragile Contents of the transport package are fragile therefore it shall be handled with care.
<u><u><u></u></u><u></u><u></u><u></u><u></u><u></u><u></u><u></u><u></u></u>	This Way Up Indicates correct up right position of the transport package.
Ť	Keep Away From Rain Transport package shall be kept away from rain.
	Stacking Limit By Number Maximum number of identical packages which may be stacked on one another is eight.
	General Warning, Caution, Risk Of Danger Please read the instructions carefully before operating the product.
⊙/Ò	Stand-by To identify the switch or switch position by means of which part of the equipment is switched on in order to bring it into the stand-by condition.

DISPLAY SCREEN PARTITION

Figure 5: Display Screen

All TFT display screen is divided into three areas:

WAVEFORM AREA

This area will display the waveforms: ECG, PLETH, RESP, ART, PA, EtCO2, Gas and so on. The waveform channel number is decided by the choice of Display Mode. Displaying waveforms are depended on the choice of Waveform Select. And also, the user can use menu to distribute the combination of window waveforms and oxyCRG.

PARAMETER AREA

This area consists of HR, RESP, SpO₂, TEMP, NIBP(SYS, DIA, MAP), EtCO₂, Gas and so on. Of course, the user can use menu to distribute the combination of window Parameters and NIBP data list.

MESSAGE AREA

Time, Patient Information, Power State and some prompt information are list here.

On the condition of main screen displaying, touch each menu item, it can pop up the correlated menu for setup. Access to choosing item (enter submenu if available) and change the value of item. If you want to exit from menu, just touch EXIT or OK (or CANCEL)

[NOTE]: The function of Rotary Knob is equal to touch directly. In this manual, we only describe the operation for touch-screen. Of course, the user can finish all operation by Rotary Knob.

[NOTE]: The function of soft-key is equal to hard-key in the panel. In this manual, we only describe the operation for soft-key. Of course, the user can finish relevant operation for Start/stop NIBP, Silence, System setup, Trend, Print by hard-key.

SYSTEM SETUP

System Setup includes: Factory Setup, Optional Module, Waveform Select, Printer, Config Manager, Drug Calculation, Hemodynamic, Language, Display Mode, Alarm Suspend, Sweep Direction and etc.

Press the button of **SETUP** to pop up the menu below:

Figure 6: Tree Diagram for System Setup Menu

FACTORY SEVICING SETUP

Servicing engineer use only.

1. If inputting "IP SETUP" for the password, the window for Ethernet IP address setup of

the Patient Monitor will pop out. It is used for connecting between Patient Monitor and Central Station. This IP address is available only when the patient monitor is re-powered on.

2. If inputting "NUIPSET." for the password, you can set the remote address, which should be as same as server IP, when you upgrade the program using Ethernet.

OPTIONAL MODULE

You can input different passwords to open the relevant modules such as IBP, EtCO2, Gas, 12-Lead ECG and HL7 interface.

WAVEFORM SELECT

Select **WAVEFORM SETUP** item to pop up the menu of system Setup.

The waveforms from top to bottom can be selected from ECG I, ECG II, ECG III, ECG avR, ECG avL, ECG avF, ECG V, Pleth, Resp, IBP1, IBP2, EtCO2, and AG.

The IBP1, IBP2, EtCO2, AG could be chosen only when the related module be opened. If the ECG Lead Type is 12-lead, screen can display full 12-lead ECG waveforms.

PRINTER

Pick **PRINTER** item in the SYSTEM SETUP menu to finish the settings below.

STATUS

Use to display the connecting state of printer. Connected or Disconnected.

GRID OUTPUT

ON to make waveform print out has a net background, just like record paper. Contrary when closed.

ALARM PRINT

If this item is set to ON, It can print a slip of waveform of 10 seconds (the preceding 4 seconds before the recording till the current 4 seconds) when an alarm is happened.

AUTO PRINT

5 minutes, 10 minutes, 20minutes, 30 minutes and 60 minutes are for choice, if the "Parameters Only" menu is set to on, after related interval, it will only print parameters' value automatically. If it is set to off, it will print Waveform and Parameters' value automatically. Also, you can choice "OFF", and then the print should be executed by manual.

PARAMETERS ONLY

If this item is set to ON, It could print the parameters' value only. For example HR, NIBP, RR, SpO₂, IBP1, IBP2, ST, T1, T2, EtCO2, nN2O, inENF and expENF and so on.

WAVEFORM 1 or 2 or 3

This item is to choose what waveform is to print out.

HOSPITAL NAME

Click this item to input or change the hospital name. When click the input name location, a keypad will display, you can select any word on it as following picture:

						Input	ASCIIs			
< maxi	imum of	20 cha	aracter	s in le	ength >					
1	Z	3	4	5	6	7	8	9	0	
Q	W	Е	R	т	Y	U	I	0	Р	
Ĥ	s	D	F	G	Н	J	к	L	-	
Z	x	С	Ų	в	N	M	,		-	
SPACE						DEL	CLR	RST		
										√ 0k
										× Cance 1
	ital na									

Figure 7: Keypad to input ASCIIS

CONFIG MANAGER

LOAD USER CONFIG

If the parameter settings are confused on irrational, you can call the Default Config to recover original state. Also you can choose the setting which is saved by yourself. The screen will display a menu to let you confirm the setup.

After return to the above confirmation menu, a message of "Load Configuration Data Success!" will display in the message highlight area, showing that the system has begun to work with the new settings.

SAVE CURRENT CONFIG

You can change monitor settings as required and then save the changed settings into a user configuration so that system can call up these settings at the next time of open. You will be asked to input the user's name in order to distinguish different settings. The Patient Monitor can save multiple user configurations. The screen will display a menu to let you confirm the setup:

After return to the above confirmation menu, a message of "Config Data Saved!" will display in the message highlight area, showing that the system and all monitoring parameter settings have been saved (see each chapter).

[NOTE]

Make sure that the changes are suitable for your patient.

DELETE USER CONFIG

Delete the user config saved before.

DRUG CALCULATION

Refer to the CALCULATION section for details.

HEMODYNAMIC CAL

Refer to the CALCULATION section for details.

LANGUAGE SETUP

Use to select language for the monitor system. The language can be switched only after inputting the correct password of "language".

DEMO DISPLAY

The Demo mode is for demonstration purpose only. To avoid that the simulated data are mistaken for the monitored patient's data, you must not change into demo mode during monitoring, otherwise, improper patient monitoring and delayed treatment could result.

This function is for servicing engineer only.

OTHER SETUP

SOUND LEVEL

I, II, III, IV and OFF for choice. IV means the loudest sound.

HEART SOUND

QRS, Pulse, IBP1, IBP2 or OFF for choice, the factory-set is QRS.

SCREEN CALIBRATE SETUP

This function is for servicing engineer only.

HOW TO MONITOR

- 1. According to the parameter needed, connect the correlated sensors to the sockets on the left panel;
- 2. Connect with the power supply, press the power switch in the front panel;
- 3. Power indicator is bright, the display screen enter the main screen after 25 seconds;
- 4. Connect the detector with the patient;
- 5. Set monitoring parameters (see chapters below) ;
- 6. Enter the monitoring state.

CAUTION: If the TRANQUILITY II is to be stored for a period of 2 months or longer, notify service personnel to remove the battery from the monitor prior to storage. Recharge the battery when the battery has not been recharged for 2 or more months.

CAUTION: Follow local government ordinances and recycle instructions regarding disposal or recycling of device components, including batteries.

DISPLAY MODE

- OXYCRG SCREEN
- LARGE FONT SCREEN

TRANQUILITY II Patient Monitor has five modes for display such as 8 Waveforms, 6 Waveforms, 3 Waveforms, Large Font and OxyCRG.

In addition, when the module for 12-Lead is opened, you can also choose the display mode for Full 12-Lead ECG.

Especially, 3 Waveforms mode is usually used when the ECG Lead Type is 3 Leads. When the Lead Type is 5 Leads, the default display mode is 6 Waveforms; when the Lead Type is 12 Leads, the default display mode is Full 12-Lead. Also you can set the display mode as required.

OXYCRG SCREEN

To have a split screen view of oxyCRG, you could select Display Mode for oxyCRG. The interface is as below:

Figure 8: Window for oxyCRG

The split screen view covers the lower part of the waveform area and shows HR Trend, SpO_2 Trend and RR Trend (or Resp Waveform). At the bottom, there are controls as below:

OXYGEN SETUP

TIME

In the time menu, you can select 1 minute, 2 minutes, 4 minutes and 8 minutes **RR/RESP**

You can select either RR Trend or Resp Waveform for display.

PRINT

Through this soft-key, you can print out the currently displayed oxyCRG trends by the printer.

LARGE FONT SCREEN

To enter the big numeric screen: select the Display Mode for Large Font. The interface is as below:

Figure 9: Window for Large Font

You can select your desired parameters to display in this screen.

In the Waveform Select menu, you can select the waveform related to the parameter you want. For example: if you want display the big numeric of SpO_2 value and PR value in the screen, you could select the Pleth in the channel1 or other channel. For parameters having a waveform, the waveform will also be displayed.

[NOTE]: The first ECG Waveform is corresponding to HR Value. The second ECG Waveform is to NIBP Value. The third ECG Waveform is to Temp Value. The other ECG Waveform is to nothing.

ALARM & SOUND

ALARM

When the monitor detects certain conditions that require user attention, the TRANQUILITY II Patient Monitor enters an alarm state. The monitor response is indicated by:

- Visual alarm indicators
- Audible alarm indicators
- Print-on-alarm (if printer installed)
- Identification of out-of-limit vital signs in trend data

ALARM SETUP

ALARM PRIORITY

The monitor's visual and audible responses to a detected alarm depend on the priority of the alarm; High, Medium, or Low.

A higher priority alarm will supersede a lower priority alarm.

The three categories of alarms are summarized in the following paragraphs. The text indicates the message shown on the screen.

In this menu, you can set the alarm priority, which functioned when the parameters' numeric value limits violated, for HR, ARR, ST, SpO₂, PR, Resp, NIBP, Temp, IBP and $EtCO_2$, each priority has two items for choice, High and Medium. The default is all medium.

HIGH PRIORITY

Indicating that immediate OPERATOR response is required:

Asystole (4 seconds have passed with no heart beats from ECG, preceded by detecting valid ECG-derived heart rate data.) Loss of Pulse from SpO₂ (and no valid ECG)

MEDIUM PRIORITY

Indicating that prompt OPERATOR response is required:

High/Low numeric value limits violated (such as High/Low SpO₂ limits violated, High/Low Sys./Dia. blood pressure limits violated, High/Low Respiration Rate limits violated, High/Low Temperature limits violated, etc.)

LOW PRIORITY

Indicating that OPERATOR awareness is required:

Senor or leads off (such as ECG Leads Off, SpO₂ Cable/Sensor Disconnect, Temperature Probe Disconnect, etc.), Low Battery (alarm commences when the TRANQUILITY II has at least 10 minutes of operating time remaining) and communications errors for modules.

ALARM LIMITS

In the menu, you can set all the Parameters' Alarm Limits as you need. The setting here is equivalent to set in relevant Parameter Setup Menu. The same menu item will change at the same time.

WARNING: Before using the monitor each time, check alarm limits to ensure that they are appropriate for the patient being monitored.

VISUAL ALARM INDICATORS

When an alarm occurs, the TRANQUILITY II responds with visual alarm indications. The flashing rates for the three categories of alarms are shown. The TRANQUILITY II uses flashing colors to indicate high and medium priority alarm as following Flashing Rates.

Alarm Category	Flashing Rate
High Priority	Two flashes in 1 second
Medium priority	One flash in 2 seconds
Low priority	Constant (on) (non-flashing)

When a low priority alarm occurs, a non-flashing alarm message appears in the message area. If more than one low priority alarm is present, the alarm messages "rotate". On the TRANQUILITY II numeric frame background color will change to a solid yellow for a low priority alarm

A medium priority alarm is activated when a parameter is outside its alarm limits, the out-of-limit numeric value and the bell icon in the corresponding Numeric Frame flash at the medium priority rate. Only the numeric frame background color will flash yellow for a medium priority alarm in the TRANQUILITY II.

When the high-priority Asystole alarm occurs, the heart rate numeric value and the corresponding bell icon flash at the high priority rate. Only the numeric frame background color will flash red for a high priority alarm in the TRANQUILITY II. A non-flashing Asystole message appears in the message area and will override any other messages which may be present (there is no message "rotation" in this instance).

ALARM SUSPEND

if you want to temporarily prevent alarms from sounding, you can pause alarms by pressing the softkey or hardkey "Silence". When alarms are suspended:

- No alarm lamps flash and no alarms are sounded.
- No alarm messages are shown.
- The remaining pause time is displayed in the alarm prompt area.

During Alarm Suspend, monitoring continues for all parameters; the numeric values and waveforms continue to operate normally. Trend memory operates normally. The single-function buttons continue to operate normally.

The Patient Monitor enters into the alarm paused status as soon as it is turned on. The user can set the suspend time in the Alarm Suspend Menu. There are four items for choice. 1 minute, 2 minute, 3 minute, Permanent.

When the alarm pause time expires, the alarm suspended status is automatically cancelled. Also you can press the "Silence" key to terminate the alarm suspended condition. If you choose "Permanent", it means that the alarms suspend permanently.

WARNING: DO NOT switch off or pause or decrease its volume to the alarm if patient safety could be compromised.

ALARM SWITCH

When any alarm switch is set to be OFF, the alarm indicator will not light, the relative

alarm parameter will not flash and relative parameter area will appear an icon of

SOUND

ALARM SOUND

Like the mild sound of BEEP. There are four items of I, II, III and IV for alarm levels in turn from low to high.

The following encoded auditory alarm signals categorized by alarm condition and priority:

Alarm Category	Encoded Auditory			
High Priority	C C C -C C			
Medium priority	CCC			
Low priority	eC			
[NOTE 1]: The characters c,e refer to relative musical pitches and C is one octave c.				
[NOTE 2]: A high priority alarm signal is generated with the five pulses, repeat				
once, for total of 10 pi	ilses.			

HEART-BEAT (PULSE-TONE)

The heart-beat or pulse-tone is a sound of RUB-A-DUB. In the Setup menu, there are QRS, PULSE, IBP1, IBP2 and OFF for choice, when the choice is QRS, the system will sound by heart-beat sound. When the choice is PULSE, the system will sound by pulse-tone sound and the sound frequency is changed with the SpO2 Value. When the choice is IBP1 or IBP2, the system will sound by IBP sound. When the choice is OFF, the system will close the heart-beat sound or pulse-tone or IBP.

KEY BEEPS

The key beep sounds come along with clicking function items.

SILENCE

Click this function button to disable all sounds except for the key beeps. A symbol of displays in the message area, click this button again to restore all sounds except for the key beeps.

ECG MONITORING

- ELECTRODE INSTALLATION
- CABLE AND LEADWIRE INSTALLATION
- ECG SETUP
- 12-LEAD ECG MONITORING
- ERROR MESSAGES OF ECG MONITORING
- MAINTENANCE AND CLEANING

ELECTRODE INSTALLATION

Some points should be paid attention to in ECG monitoring.

- 1. Check the lead and cable. The damaged or ruptured one cannot be used.
- 2. Link up the lead set and cable, and connect the electrode to the lead.
- 3. Choose the suitable skin at which the electrode should be pasted. Use alcohol to clean the skin and remove the skin grease. Paste the electrode on the patient and check that whether they are contact well.
- 4. The electrodes must be moved away to check the skin every 24 hours, if the skin is found inflamed of damaged evidently, substituted a new electrode to another position.
- 5. Make sure no conductive part of electrodes is in contact with the ground and other conductive.

5-Leadwire Electrode Placement

Follow the methods below to place the 5-lead electrode.

Figure 10: 5-lead Electrode Placement

□ WHITE (RIGHT ARM) ELECTRODE (RA)—is placed near the right shoulder, directly below the clavicle.

 $\hfill\square$ BLACK (LEFT ARM) ELECTRODE (LA)—is placed near the left shoulder, directly below the clavicle.

□ GREEN (REFERENCE) ELELCTEODE (RL)—is placed on the right hypogastria.

- □ RED (LEFT LEG) ELELCTEODE (LL)—is placed on the left hypogastria.
- BROWN(CHEST)ELECTRODE(V or C)-is placed on the chest as illustrated below:

[NOTE]

- Only the ECG cable presented by our factory can be used.
- □ To ensure patient safety, all leads must be attached to the patient.

For 5-lead set, attach the C-electrode to one of the indicated positions as below:

Figure 11: C-electrode Placement

- $\hfill\square$ V1 is on the 4th intercostal space at the right sterna margin.
- $\hfill\square$ V2 is on the 4th intercostal space at the left sterna margin.
- $\hfill\square$ V3 is at the midway between V2 and V4 electrodes.
- □ V4 is on the 5th intercostal space at the left clavicular line.
- $\hfill\square$ V5 is on the left anterior axillary line, horizontal with V4 electrode.
- □ **V6** is on the left middle axillary line, horizontal with V4 electrode.
- □ V3R-V7R is on the right side of the chest in positions corresponding to those on the left.

 $\Box~$ VE is over the xyphoid. As for the V-lead position on the back, it should be placed at one of the positions below.

- □ V7 is on the 5th intercostals space at the left posterior axillary line of back.
- □ **V7R** is on the 5th intercostals space at the right posterior axillary line of back.

12-Leadwire Electrode Placement

12-lead ECG uses 10 electrodes, which are placed on the patient's four limbs and chest. The limb electrodes should be placed on the soft skin and the chest electrodes placed according to the physician's preference.

Lead Placement for Surgical Patients

The surgical site should be taken into consideration when placing electrodes on a surgical patient. e.g. for open-chest surgery, the chest electrodes can be placed on the lateral chest or back. To reduce artifacts and interference from electrosurgical units, you can place the limb electrodes close to the shoulders and lower abdomen and the chest electrodes on the left side of the mid-chest. Do not place the electrodes on the upper arm. Otherwise, the ECG waveform will be very small.

Figure 12: 12-Lead Electrode Placement

WARNING:

- When using electrosurgical units (ESU), patient leads should be placed in a position that is equal distance from the Electrosurgery electrotome and the grounding plate to avoid burns to the patient. Never entangle the ESU cable and the ECG cable together.
- When using electrosurgical units (ESU), never place ECG electrodes near to the grounding plate of the ESU, as this can cause a lot of interference on the ECG signal.

CABLE AND LEADWIRE INSTALLATION

- 1. Insert the plug of ECG into socket on the left panel of monitor, make sure that the salient of plug is direct to the notch of socket when inserting.
- 2. Connect the electrode lead to the patient's cable.

ECG SETUP

Touch the ECG Waveform or Parameter area directly. This menu can finish settings below:

Figure 13: Tree Diagram for ECG Setup

ALARM SWITCH

ON and OFF for choice, the factory-set is **ON**.

If the HR value is above or below the HR alarm limit, when the choice is **ON**, the alarm is activated; when the choice is **OFF**, the alarm indicator will not light, the relative alarm

parameter will not flash and relative parameter area will appear an icon of A.

HR ALARM HIGH

The range is: $80 \sim 400$ bpm, the factory-set is 130 bmp, the single-step adjustable step-length is 5 bpm.

HR ALARM LOW

The range is: $20 \sim 150$ bpm, the factory-set is 50 bmp, the single-step adjustable step-length is 5 bpm.

ECG LEAD

When the Lead Type is 5 Leads or 12 Leads, the item is not selectable. When the Lead is 3 Leads, you can choose it for Lead I or Lead II or Lead III.

ECG GAIN

The user can freely choose one from items of X0.25, X 0.5, X1.0 and X2.0. The bigger the gain is, the larger the waveform amplitude is. The factory-set is **X1.0**. When the display mode is 10 Waveforms, it could not choose the item for X2.0.

ECG FILTER

The ECG Filter setting defines how ECG waveforms are smoothed. Freely select three different modes which are Surgery, Monitor or Diagnose. The factory-set is Monitor.

- Monitor: Use under normal measurement conditions
- Diagnose : Use when diagnostic quality is required. The unfiltered ECG waveform is displayed so that changes such as R-wave notching or discrete elevation or depression of the ST segment are visible.
- Surgery: Use when the signal is distorted by high frequency or low frequency interference. High frequency interference usually results in large amplitude spikes making the ECG signal look irregular. Low frequency interference usually leads to wandering or rough baseline. In the operating room, the surgery filter reduced artifacts and interference from electrosurgical units. Under normal measurement conditions, selecting 'Surgery' may suppress the QRS complexes too much and then interfere with ECG analysis.

ECG NOTCH

The notch filter removes the line frequency interference. When ECG filter is Monitor or Surgery mode, the notch filter always stays on. Only when the filter is Diagnose mode, you can switch the notch filter on or off as required. ECG notch can be set 50Hz or 60Hz according to power line frequency. The factory-set is 50Hz.

LEAD TYPE

3 leads and 5 leads for choice, the factory-set is 5 leads. 12-lead can be chosen only when the ECG 12-Lead is ON in Optional Module.

ECG CASCADE

ON or OFF, if choose ON, an ECG waveform will take up two channels. After filled up with the first channel, the waveform will follow the second channel. In the cascade mode, the waveform could only sweep from left to right. The default-set is OFF.

SWEEP SPEED

Select from 12.5 mm/s, 25 mm/s, 50 mm/s and 100 mm/s. The factory-set is 25 mm/s.

SWEEP COLOR

Select from White, Gray, Red, Yellow, Green, Cyan, Blue, and Magenta. The default-set is Green.

PACEMAKER DETECTION

It is important to set the paced status correctly when you start monitoring ECG. When the Pacemaker Detection is set to ON, the pace pulse markers "|" are shown on the ECG waveforms when the patient has a paced signal.

[WARNING]

- 1. For paced patients, you must set Pacemaker Detection to ON. If it is incorrectly set to OFF, the patient monitor could mistake a pace pulse for a QRS and fail to alarm when the ECG signal is too weak. DO NOT rely entirely on alarms when monitoring patients with pacemakers. Always keep these patients under close surveillance.
- 2. For non-paced patients, you must set Pacemaker Detection to OFF. If it is incorrectly set to ON, the patient monitor may be unable to detect premature ventricular beats (including PVCs) and perform ST segment analysis.

ECG TEST

Used by engineer only.

ECG VERIFY

Used by engineer only.

ST-SEGMENT ANALYSES

ST-segment analysis calculates ST-segment elevations and depressions for individual leads and then displays it as numeric in the ECG Parameter area. A positive value indicates ST-segment elevation; a negative value indicates ST segment depression. It is not intended for neonatal patients.

As shown in the figure below, the ST measured for each beat complex is the vertical difference between two measurement points with the R-wave peak as the baseline for the measurement.

ST ALARM SWITCH

The default value is **OFF**. The alarm is triggered when the ST measurement value exceeds the alarm limits. If the ST Alarm is **ON**, the ST value blinks, the alarm sounds and the alarm indicator flashes, and the information column will give the note that **ST HIGHER** or **ST LOWER**.

ST ALARM LIMIT

Set the ST alarm upper limit and lower limit separately. The range is: $-2 \sim 2$ mV. The default upper limit is +0.30 mV, the default lower limit is -0.30 mV. The single-step adjustable step- length is **0.02** mV.

ST ANALYSIS SWITCH

The default value is **OFF**, only the choice of **ON** can operate the ST Segment Monitoring. Meanwhile, the **TREND GRAPH** or **TREND TABLE** can be opened by the button of **TREND** to see the tendency displaying on the graph or table.

ST ADJUST

ISO (Base Point)

Set the baseline point, its adjustable range is $-508 \text{ ms} \sim -4 \text{ ms}$, the default value is -80 ms, it shows that the reference point is the position 80ms before the peak of R- wave locates.

ST (Measurement Point)

Set the measuring point, its adjustable range is +8 ms \sim +508 ms, the default value is +108ms, it shows that the reference point is the position 108 ms after the peak of R- wave locates.

These two points can be adjusted by clicking the button of << or >>. The value and the indicating line will change simultaneously.

NOTE: The ST measurement point should be adjusted if the patient's HR or ECG morphology changes significantly.

ARRHYTHMIA ANALYSIS

The monitoring system supports the self relearn function to accommodate itself to new conditions such as different patients. The user can edit the arrhythmia type. For each type system saves 8 items arrhythmia and totally saves 104 items.

WARNING:

Arrhythmia analysis program is intended to detect ventricular arrhythmias. It is not designed to detect atrial or supraventricular arrhythmias. It may incorrectly identify the presence or absence of an arrhythmia. Therefore, a physician must analyze the arrhythmia information with other clinical findings.

ARR ANALYSIS

Set arrhythmia analysis to be **ON** or **OFF**. The factory-set is **OFF**.

ARR SOURCE

Select between **lead I, lead II** and **Lead III**, and the factory-set is **lead II**. The user can switch the ECG lead if the current lead's signal is weak.

PVC MONITOR

Set PVC monitor to be ON or OFF. The factory-set is ON, if the premature ventricular contraction times exceed the PVC ALARM COUNT, the system will alarm.

PVC ALARM COUNT

Its set range is from 1 to 10. The factory-set is 10.

ARR RELEARN

Self relearn to accommodate itself to new conditions. Such as different patients, cardiograph changes a lot.

ARR ALARM SETUP

Set all kinds of arrhythmia alarm to be **ON** or **OFF**. The all factory-sets are **ON**.

- TAC --- Tachycardia
- BRD --- Bradycardia
- MIS --- Miss beat

12-LEAD ECG MONITORING

Entering the 12-lead ECG Monitoring Screen

- 1. Enable the 12-Lead ECG function in the Optional Module.
- 2. Refer to the section ECG Monitoring---->Electrode Installation for placing the electrodes.
- 3. In the ECG Setup menu, select Lead Type. Then choose 12-Lead.

Figure 16: Window for Full 12-Lead ECG

ERROR MESSAGES OF ECG MONITORING

Sometimes messages will display above the ECG waveform:

Prompts	Explanation
Lead off	ECG leads fall off the skin or the monitor
ECG Signal Weak	Monitor system can not calculate HR value when the ECG Signal is too weak.

MAINTENANCE AND CLEANING

PATIENT CABLE AND LEAD

After every times of using, the cable must be cleaned and following the methods below:

- Clear the paste on body and the remainder of electrolyte on the electrode. The paste-eradicator can be used when removing the adhesive tape remainder, but acetone, alcohol, ammonia, chloroform and other strong solvent are not suggested, because they would finally damage the vinyl cable.
- Use a sponge moistened in mild soap liquid or other suitable detergent solution to clean the cable and then dry them. Do not submerge the cable into the water.
- Check each cable to see whether they are corroded, damaged or degenerated. Do not use pressure cooker to disinfect the cable and electrode or heat them to 75 °C(167F) and higher temperature. If there is dirt on the material surface, you can use the abluent which will not left remainder to clean and any metal grinding medium like floss is forbidden. The storing temperature should be -20 °C till 75 °C(-68F till 167F). Hang or place them flat so as not to be damaged.

ADDING POINTS

HR calculating stability has a process, ECG lead switching sometimes affect HR which will become stable after a while. The change of gain and filter may influent the HR calculating stability too. Another factor which affecting HR calculation is the QRS waveform, if T wave is too high, HR will be make mistake too. Arrhythmia sometimes influent HR calculation too.

Choosing suitable ECG waveform range and complete QRS waveform has important effect in the accuracy of HR calculation.

RESP MONITORING

- RESP ELECTRODE INSTALLATION
- RESP SETUP
- MAINTENANCE AND CLEANING

RESP ELECTRODE INSTALLATION

The monitor measures respiration from the amount of thoracic impedance between two ECG electrodes. The change of impedance between the two electrodes, (due to the thoracic movement), produces a respiratory waveform on the screen.

For RESP monitoring, it is not necessary for additional electrodes, however, the placing of electrodes is important.

Some patients, due to their clinical condition, expand their chest laterally, causing a negative intrathoracic pressure. In these cases it is better to place the two RESP electrodes laterally in the right axillary and left lateral chest areas at the maximum point of breathing movement to optimize the respiratory waveform.

The sensor of RESP Electrode's installation is same as ECG's.

[NOTE]

The RESP monitoring is not recommended to be used on patients who are very active, as this can cause false alarms.

The scheme picture for placing the 5 Electrodes for Respiratory Monitoring is seen as followings:

[NOTE]

Place the red and green electrodes diagonally to optimize the respiration waveform. Avoid the liver area and the ventricles of the heart in the line between the RESP electrodes so as to avoid cardiac overlay or artifacts from pulsating blood flow. This is particularly important for neonates.

RESP SETUP

Touch the Resp Waveform Area or Parameter Area directly. You can enter the Resp Setup Menu.

Figure 17: Tree Diagram for Resp Menu

The menu can finish settings as below:

ALARM SWITCH

ON and **OFF** for choice, the factory–set is **ON**.

If the RESP value is above or below the RESP alarm limit, when the choice is **ON**, the alarm is activated; when the choice is **OFF**, the alarm indicator will not light, the relative

alarm parameter will not flash and relative parameter area will appear an icon of $\overset{\frown}{4}$.

RESP ALARM HIGH

The RESP alarm upper-limit, the range is $8 \sim 120$ bpm, and the factory-set is 30 bpm, the single-step adjustable step- length is 1 bpm.

RESP ALARM LOW

The RESP alarm lower-limit, the range is $6 \sim 100$ bpm, and the factory-set is 8 bpm, the single-step adjustable step- length is 1 bpm.

RESP GAIN

The user can freely choose one from items of X0.25, X 0.5, X1.0 and X2.0. The bigger the gain is, the larger the waveform amplitude is. The factory-set is X1.0.

SWEEP SPEED

Choose from 6.25 mm/s, 12.5 mm/s and 25.0 mm/s, and the factory-set is 6.25mm/s.

SWEEP COLOR

From White, Gray, Red, Yellow, Green, Cyan, Blue, and Magenta for choice, the default-set is Cyan.

DISPLAY

The **ON** and **OFF** for choice. Pick **ON** can display RESP, pick **OFF** would not display the RESP, but this do not influent the actual data of trend.

Applications: when the patient's thorax or abdomen is subjected too much interference, the RESP monitoring is not accurate, so it is suggested to close the RESP display.

MAINTENANCE AND CLEANING

It is the same as the ECG monitoring.

SPO2 MONITORING

- SPO2 MONITORING PRINCIPLE
- SPO2 SENSOR INSTALLLATION
- SPO2 SETUP
- MEASUREMENT LIMITATIONS
- SPO2 ERROR MESSAGES

SPO2 MONITORING PRINCIPLE

Arterial oxygen saturation is measured by a method called pulse oximetry. It is a continuous, non-invasive method based on the different absorption spectra of reduced hemoglobin and oxyhemoglobin. It measures how much light, sent from light sources on one side of the sensor, is transmitted through patient tissue (such as a finger or an ear), to a receiver on the other side.

The amount of light transmitted depends on many factors, most of which are constant. However, one of these factors, the blood flow in the arteries, varies with time, because it is pulsating. By measuring the light absorption during a pulsation, it is possible to derive the oxygen saturation of the arterial blood. Detecting the pulsation gives a PLETH waveform and pulse rate signal.

About SpO₂, SaO₂, SjvO₂

□SpO₂: It is the arterial blood oxygen saturation lever measuring by oximeter.

 \Box **SaO**₂: It is the oxygen saturation of arterial blood

SjvO₂: It is the oxygen saturation of the jugular blood.

[WARNING]

Pulse oximeter can overestimate the SpO_2 value in the presence of HB-CO, Met-HB or dye dilution chemicals.

SPO2 SENSOR INSTALLLATION

1. Insert the plug of SpO_2 sensor into the SpO_2 socket on the left panel of monitor. Make sure that the salient of plug must direct to the notch of socket when inserting of unplugging, otherwise the measurement will not be reliable and the sensor connector will be damaged.

2. Wear the finger-probe on the finger; make sure that the finger tip is the same direction as the finger direction indicated on the probe.

SPO2 SETUP

Touch the SpO₂ Waveform or Parameter area directly. As graph below:

Figure 18: Tree Diagram for SpO₂ Setup Menu

The menu can finish settings as below:

ALARM SWITCH

ON and OFF for choice, the factory-set is ON.

If the SpO_2 value is above or below the SpO_2 alarm limit, when the choice is **ON**, the alarm is activated; when the choice is **OFF**, the alarm indicator will not light, the relative

alarm parameter will not flash and relative parameter area will appear an icon of $\overset{\mbox{\ensuremath{\square}}}{\longrightarrow}$.

SPO2 ALARM HIGH

The SpO₂ alarm upper-limit, the range is **50** \sim **99** %, and the factory-set is **99%**, the single-step adjustable step- length is **1** %.

SPO2 ALARM LOW

The SpO₂ alarm lower-limit, the range is $50 \sim 99$ %, and the factory-set is 85%, the single-step adjustable step- length is 1%.

SWEEP SPEED

Choose from 12.5 mm/s to 25.0 mm/s, and the factory-set is 12.5 mm/s.

SWEEP COLOR

From White, Gray, Red, Yellow, Green, Cyan, Blue, and Magenta for choice, the default-set is Blue.

SPO2 FACTORY SETUP

Click "Factory Setup" and input "SPO2...."password, then come into "SpO₂ Setup" Menu to SpO₂ Factory Setup.

There are three SpO_2 modules for choice: BCI, Nellcor and Masimo. More detail please contact with local distributor or service engineer

This item is for servicing engineer use only.

MEASUREMENT LIMITATIONS

- 1. The measurement is decided by the pulsating characteristic of blood stream in artery or arterial blood vessel. The arterial blood stream may decreased to the level which cannot be measured in conditions below:
 - Shock
 - Hypothermia
 - Vasoactive medicines are applied
 - Anemia
- 2. The measurement are also decided by the condition how the oxyhemoglobin and reduced-hemoglobin absorb the light of special wave-length. If there are other

material can absorb the same wave-length light, they can cause the measurement false or lower than the actual value of SpO₂, for example:

- Carboxyhemoglobin
- Methemoglobin
- Methylene blue
- Carmine indigo
- 3. The strong light in the environment also can influent measurement. Some suitable light-tight material to cover the sensor which can improve the measure quality.

[WARNING]

- Prolonged and continuous monitoring may increase jeopardy of unexpected change of dermal condition such as abnormal sensitivity, rubescence, vesicle, repressive putrescence, and so on. It is especially important for neonate and patient of poor perfusion or immature dermogram to check the sensor placement by light collimation and proper attaching strictly according to changes of the skin. Check regularly the sensor placement and move it when the skin deteriorates. More frequent examinations may be required for different patients.
- DO NOT use SpO2 sensors during magnetic resonance imaging (MRI). Induced current could potentially cause burns. The sensor may affect the MRI image, and the MRI unit may affect the accuracy of the oximetry measurements.

SPO2 ERROR MESSAGES

PLETH Waveform may display messages as below:

PROMPTS	EXPLAINATION
Search Too Long	Search-time of SpO ₂ is too long
Searching For Pulse	On searching for pulse signal
Sensor Off	Sensor falls off or the finger fails to insert into the finger-probe
SpO2 Com Error	SpO ₂ board has communication error with the mainboard

MASIMO INFORMATION

TRADEMARK AND LICENSING LABELS

MASIMO PATENTS

This device is covered under one or more the following U.S.A. patents: 5,758,644; 5,823,950; 6,011,986; 6,157,850; 6,263,222; 6,501,975; 7,469,157 and other applicable patents listed at http:// www.masimo.com/patents.htm.

NO IMPLIED LICENSE

Possession or purchase of this device does not convey any express or implied license to use the device with unauthorized sensors cables which would, alone, or in combination

with this device, fall within the scope of one or more of the patents relating to this device.

NELLCOR INFORMATION

TRADEMARK AND LICENSING LABELS

NELLCOR PATENS

This device is covered under one or more the following U.S. Patents: 4,802,486; 4,869,254;4,928,692; 4,934,372; 5,078,136; 5,351,685; 5,485,847; 5,533,507; 5,577,500; 5,803,910;5,853,364; 5,865,736; 6,083,172; 6,463,310; 6,591,123; 6,708,049; Re.35,122 and international equivalents U.S.A international patents pending.

NO IMPLIED LICENSE

Possession or purchase of this device does not convey any express or implied license to use the device with unauthorized replacement parts which would, alone, or in combination with this device, fall within the scope of one or more of the patents relating to this device.

NIBP MONITORING

- NIBP MONITORING PRINCIPLE
- NIBP CUFF FITTING
- NIBP MONITORING INITIALIZATION
- NIBP SETUP
- NIBP LIST OBSERVATION
- MEASUREMENT LIMITATIONS
- NIBP ERROR MESSAGES
- MAINTAINENCE AND CLEANING

NIBP MONITORING PRINCIPLE

The Non-invasive Blood Pressure (NIBP) module measures the blood pressure using the oscillometric method.

It is applicable for adult, pediatric and neonatal usage.

There are three modes of measurement available: **Manual**, **Automatic** and **Stat**. Each mode displays the diastolic, systolic and mean blood pressure.

[WARNING]

- You must not perform NIBP measurements on patients with sickle-cell disease or under any condition which the skin is damaged or expected to be damaged.
- For a thrombasthenia patient, it is important to determine whether measurement of the blood pressure shall be done automatically. The determination should be based on the clinical evaluation.
- Before starting a measurement, verify that you have selected a setting appropriate for your patient(adult, pediatric or neonate.) Ensure that the correct setting is selected when performing measurements on neonate, because the higher adult BP level is not suitable for neonate, it may be dangerous for the neonate to use an over pressure level.
- DO NOT apply the cuff to a limb that has an intravenous infusion or catheter in place. This could cause tissue damage around the catheter when infusion is slowed or blocked during cuff inflation.

NIBP CUFF FITTING

1. Whether choosing the suitable cuff which match the arm of patient influent much on the accuracy of NIBP measurement. The cuff width recommend by **AMERICA HEART SOCIETY** is the 40% of upper arm circumference or the 2/3 of the upper arm length.

- 2. Apply the blood pressure cuff to the patient's arm:
- Make sure that the cuff is completely deflated.
- Apply the appropriate size cuff to the patient, and make sure that the symbol "φ" is over the appropriate artery. Ensure that the cuff is not wrapped too tightly around the limb. Excessive tightness may cause discoloration and eventual isocheimal of the extremities.
- 3. Make sure that the cuff has not been twisted.

4. Insert the air pipe into the **NIBP** socket on the left panel of monitor. Ensure that the spring block on the left side of socket has been pressed

When inserting or unplugging the pipe, otherwise measurement process will be irregular and the sensor connector will be damaged.

[WARNING] The width of the cuff should be either 40% of the limb circumference (50% for neonates) or 2/3 of the upper arm length. The inflatable part of the cuff should be long enough to encircle 50-80% of the limb. The wrong size of cuff can cause erroneous readings. If the cuff size is in question, then use a larger cuff. Make sure that the cuff edge falls within the range of ⟨-⟩. If does not, change a more suitable cuff. Connect the cuff to the air hose. The limb chosen for taking the measurement should be placed at the same level as the patient's heart. If this is not possible you should apply the following corrections to the measured values: If the cuff is placed higher than the heart level, add 0.9mmHg (0.12kPa) for each inch of difference.

If it is placed lower than the heart level, deduct 0.9mmHg (0.12kPa) for each inch of difference.

NIBP MONITORING INITIALIZATION

After opening the host machine, check the information indicating area before NIBP monitoring, if there is a note of NIBP MODULE SELF-CHECK OK, it shows that the NIBP module operate well, then begin NIBP monitoring, and the NIBP monitoring before this information is invalid; if there is NIBP MODULE SELF-CHECK ERROR, it shows that the NIBP module cannot be proceeded, press the button of **START/STOP** to give another time of self-checking or machine-opening, if it is also this information, contact with servicing engineer.

NIBP SETUP

Touch the NIBP Parameter Area to pop up the NIBP Setup menu.

Figure 19: Tree Diagram for NIBP Setup Menu

This menu can finish settings below:

ALARM SWITCH

ON and OFF for choice, the factory-set is ON.

If the NIBP value is above or below the NIBP alarm limit, when the choice is ON, the alarm is activated; when the choice is **OFF**, the alarm indicator will not light, the relative alarm \downarrow

parameter will not flash and relative parameter area will appear an icon of

PRESSURE UNIT

mmHg or kPa, the factory-set is mmHg.

PATIENT TYPE

ADULT TYPE

It can apply to the adult mode. In the initiated measurement, inflate the cuff to 180mmHg (24kPa), if the NIBP value cannot be measured, then inflate the cuff to higher than the form value by 50mmHg (6.7kPa), the maximum value cannot exceed 280mmHg (37.3kPa), and the enduring pressure range is 50-280mmHg. The factory–set is ADULT TYPE.

PEDIATRIC/NEONATAL TYPE

It can apply to the **PEDDIATRIC or NEONATAL** mode. In the initiated measurement, inflate the cuff to 60mmHg (8kPa), if the NIBP value cannot be measured, then inflate the cuff to higher than the form value by 30mmHg (4kPa), the maximum value cannot exceed 150mmHg (20kPa), and the enduring pressure range is 50-150 mmHg.

If this setup is before the NIBP module initiation, the set is not effective.

Inflating range showing above has been realized on NIBP, NIBP use this inflation range to make sure the safety of patient.

INFLATION TYPE

There are three items for choice. Manual, Auto and STAT.

MANUAL MODE:

Press the button of **START/STOP** to begin inflation, the information indicating area display "Manual measuring... "which shows that it is on measurement just the moment.

If the NIBP measurement is finished, NIBP parameter area will display values and the information indicating area will give a note of "Manual measuring end!", then the measurement process finished.

If the NIBP value cannot be measured, NIBP parameter area will display error messages and automatically begin three times of measurement again, if the value cannot be measured also, the information indicating area will give a note of "RETRY OVER!" and never measure again.

During the measurement, press the button of **START/STOP** again will stop the NIBP measurement process and the information indicating area will give a note of STOP MANUAL MEASURING.

AUTOMATICAL MODE

NIBP parameter area will display the countdown of "Auto measuring..." (TIME INTERVAL), so long as reaching the zero point, machine will automatically precede inflating measurement again and again until the mode be changed.

Start a measurement manually. The monitor will then automatically repeat NIBP measurements at the set time interval.

If the NIBP measurement is finished, NIBP parameter area will display values and the information indicating area will give a note of "Auto measuring end!". And then begin another measurement until the mode is changed.

If the NIBP value cannot be measured, NIBP parameter area will display error messages and the first measurement automatically begin three times of measurement again, if the value cannot be measured. Also, the information indicating area will give a note of "RETRY OVER!" and automatically go on the next measurement until the mode is changed.

If the button of **START/STOP** be pressed during any period of countdown, it is immediately begin inflation measurement.

During the measurement, press the button of **START/STOP** again will stop this period of NIBP measurement process and the information indicating area will give a note of "Stop

auto measuring", but the automatic measurement period is continuous.

[WARNING]

Prolonged non-invasive blood pressure measurements in Auto mode may be associated with purport, isocheimal and neuropathy in the limb wearing the cuff. When monitoring a patient, examine the extremities of the limb frequently for normal color, warmth and sensitivity. If any abnormality is observed, stop the blood pressure measurements.

STAT MODE

In the stat mode, it will measure NIBP continually for three times. And then it will end automatically. Of course, you can press the button of **START/STOP** to end the measurement manually.

Press the button of **START/STOP** to begin inflation, the information indicating area display "STAT measuring..." which shows that it is on measurement just the moment; If the NIBP measurement is finished, NIBP parameter area will display values and the information indicating area well give a note of "STAT measuring end".

If the NIBP value cannot be measured, NIBP parameter area will display error messages and automatically begin three times of measurement again, if the value cannot be measured also, the information indicating area will give a note of "RETRY OVER!", and then continue another time of measurement which lasts 5 minutes and then stop.

During the measurement, if press the button of **START/STOP** again, the information indicating area will give a note of "STOP STAT TEST" to stop the NIBP measurement and exit from this mode.

[NOTE]

The value having been measured will display on the NIBP parameter area for 240 minutes unless a new measurement begin during this period. On the appropriate trend graph and trend table, the parameter will exist for correlated time length.

TIME INTERVAL

This setting is used supported by **automatic** inflation mode. You can input the time interval as you want. The range is 1 min to 4 hours.

Limits Patient Type	SYS UPPER LIMIT(mmHg)	SYS LOWER LIMIT(mmHg)	DIA UPPER LIMIT(mmHg)	DIA LOWER LIMIT(mmHg)
Adult	30~240	30~240	15~180	15~180
	Factory-set:150	Factory-set:100	Factory-set:90	Factory-set:50
Neonatal	30~240	30~240	15~180	15~180
	Factory-set:90	Factory-set:40	Factory-set:60	Factory-set:20
Pediatric	30~240	30~240	15~180	15~180
	Factory-set:120	Factory-set:70	Factory-set:70	Factory-set:40

ALARM LIMIT SETUP

The single-step adjustable length of alarm limit above is 5 mmHg.

FACTORY SETUP

Servicing engineer uses this function only.

NIBP LIST OBSERVATION

Touch the NIBP List Area to pop up the NIBP List Tabular. Touch again will put away the NIBP List.

NO.	Time	NIBP List
1	01/17 15:58:32	120/80
2	01/17 15:58:13	120/80
3	01/17 15:57:54	120/80
4	01/17 15:57:35	120/80
5	01/17 15:57:16	120/80
6	01/17 15:56:57	120/80
Pag	eDown PageUp	Print

Figure 20: Window for NIBP List Observation

The NIBP list can save 256 groups of data.

[NOTE]

Only after the NIBP value has been measured can it be added to the NIBP Data List. NIBP list can save 256 groups of data at all, if exceed, the new data will kick the most former data out of the list and be added to the list automatically.

MEASUREMENT LIMITATIONS

To different patient conditions, the oscillometric measurement has certain limitations. The measurement is in search of regular arterial pressure. In those circumstances when the patient's condition makes it difficult to detect, the measurement becomes unreliable and measuring time increases. The user should be aware that the following conditions could interfere with the measurement, making the measurement unreliable or longer to derive. In some cases, the patient's condition will make a measurement impossible.

PATIENT MOVEMENT

Measurements will be unreliable or may not be possible if the patient is moving, shivering or having convulsions. These motions may interfere with the detection of the arterial pressure pulses. In addition, the measurement time will be prolonged.

CARDIAC ARRHYTHMIA`S

Measurements will be unreliable and may not be possible if the patient's cardiac arrhythmia has caused an irregular heartbeat. The measuring time thus will be prolonged.

HEART-LUNG MACHINE

Measurements will not be possible if the patient is connected to a heart-lung machine.

PRESSURE CHANGES

Measurements will be unreliable and may not be possible if the patient's blood pressure is changing rapidly over the period of time during which the arterial pressure pulses are being analyzed to obtain the measurement.

SEVERE SHOCK

If the patient is in severe shock or hypothermia, measurements will be unreliable since reduced blood flow to the peripheries will cause reduced pulsation of the arteries.

HEART RATE EXTREMES

Measurements cannot be made at a heart rate of less than 40 bpm and greater than 240 bpm.

NIBP ERROR MESSAGES

Message indicating area may display messages like below:

Patient moving!	Serial error
Pressure < 10 mmHg!	NIBP renew self-check
Pressure < 1.3 kPa!	NIBP self-check
Pressure > 325 mmHg!	NIBP self-check error!
Pressure > 43.3 kPa!	NIBP inter error !
Serial overtime!	Patient type error !
Reset error!	Setup patient
Zero reset error !	NIBP self-check ok!

MAINTAINENCE AND CLEANING

[NOTE]

DO NOT squeeze the rubber tube on the cuff.

REUSABLE BLOOD PRESSURE CUFF

The cuff can be sterilized by means of conventional autoclaving, gas or radiation sterilization in hot air ovens or disinfected by immersion in decontamination solutions, but remember to remove the rubber bag if you use this method. The cuff should not be dry-cleaned. The cuff can also be machine-washed or hand-washed; the latter method may prolong the service life of the cuff. Before washing, remove the latex rubber bag, and for machine-washing, close the Velcro fastening. Allow the cuff to dry thoroughly after washing, and then reinsert the rubber bag.

To replace the rubber bag in the cuff, first place the bag on top of the cuff so that the rubber tubes line up with the large opening on the long side of the cuff. Now roll the bag lengthwise and insert it into the opening on the long side of the cuff. Hold the tubes and the cuff and shake the complete cuff until the bag is in position. Thread the rubber tubes from inside the cuff, and out through the small hole under the internal flap.

TEMP MONITORING

- THEORY OF OPERATION
- TEMP SENSOR INSTALLATION
- TEMP SETUP
- TEMP ERROR MESSAGES
- MAINTAINENCE AND CLEANING

THEORY OF OPERATION

The monitor provides one or two isolated temperature measurement channels (T1 and T2). If the second temperature channel is installed, the temperature difference between the two channels is an available option. Temperature difference is displayed as " Δ T" or delta temperature.

The monitor utilizes a temperature probe with a thermistor to give continuous electronic temperature readings of either core body temperature via rectal/esophageal probe or skin temperature via an external sensor.

TEMP SENSOR INSTALLATION

1.Insert the plug of **T1 or/and T2** sensor into the sensor socket on the left panel of monitor.

2.Put the probe on the patient according to the explanation of probe usage (lacuna and body).

[WARNING]

Inspect the probe for wear or splitting after every disinfection/sterilization process is complete. If wearing or splitting of the probe is found upon visual inspection, a new probe should be used.

TEMP SETUP

Touch the Temp parameter area to pop up the menu of TEMP Setup, see below:

Figure 21: Tree Diagram for Temp Setup Menu

The menu can finish settings as below:

ALARM SWITCH

ON and **OFF** for choice, the factory–set is **ON**.

If the TEMP value is above or below the TEMP alarm limit, when the choice is **ON**, the alarm is activated; when the choice is **OFF**, the alarm indicator will not light, the relative

alarm parameter will not flash and relative parameter area will appear an icon of $\overset{\checkmark}{\searrow}$.

TEMP UNIT

Fahrenheit or Celsius for choice, the factory-set is Celsius.

TEMP ALARM UPPER-LIMIT

The T1 or T2 alarm upper-limit, the range is $10 \sim 50$ °($50 \sim 122$ °F), and the factory-set is **38.0** (00.4°F), the single-step adjustable step- length is **0.1** (0.2°F).

TEMP ALARM LOWER-LIMIT

The T1 or T2 alarm lower-limit, the range is $10 \sim 50$ (60~122 °F), and the factory-set is 36 (96.8 °F), the single-step adjustable step- length is 0.1 (0.2 °F).

TEMP ADJUST

This item is for servicing engineer use only.

TEMP ERROR MESSAGES

TEMP SENSSOR OFF: the TEMP probe falls off the monitor.

MAINTAINENCE AND CLEANING

REUSABLE TEMP PROBES

1. The TEMP probe should not be heated above 100° C (212°F). It should only be subjected briefly t temperatures between 80°C (176°F) and 100°C (212°F).

- 2. The probe must not be sterilized in steam.
- 3. To clean the probe with alcohol detergent solution.

4. To clean the probe, hold the tip with one hand and with the other hand rubbing the probe down in the direction of the connector using a moist lint-free cloth.

ETCO2 MONITORING (OPTION)

- THEORY OF OPERATION
- WARNINGS
- ABBREVIATIONS AND TERMINOLOGY
- ZEROING THE CO2 MODULE
- PATIENT AND TUBING PREPARATION
- ETCO2 SETUP
- ADVANCED SETUP
- CALIBRATION
- STATUS/ERROR MESSAGES
- MAINTENANCE AND CLEANING

THEORY OF OPERATION

Carbon dioxide monitoring is used to monitor continuous carbon dioxide and report the End Tidal carbon dioxide ($EtCO_2$), inspired CO_2 and respiratory rate values of the intubated and non-intubated adult, pediatric, infant and neonatal patient.

In carbon dioxide monitoring system, infrared light is generated by the sensor and beamed through the sample cell to a detector on the opposite side. CO_2 from the patient that is aspirated into the sample cell absorbs some of this infrared energy. The monitor determines CO_2 concentration in the breathing gases by measuring the amount of light absorbed by these gases. EtCO₂ is displayed as a numerical value in millimeters of mercury (mmHg), percent (%), or kilopascals (kPa). In addition, a CO_2 waveform (capnogram) may be displayed which is a valuable clinical tool that can be used to assess patient airway integrity and proper endotracheal tube (ETT) placement. Respiration rate is calculated by measuring the time interval between detected breaths.

There are two methods for measuring CO₂ in the patient's airway:

- 1. Mainstream measurement uses a CO₂ sensor attached to an airway adapter directly inserted into the patient's breathing system.
- 2. Sidestream/Microstream measurement samples expired patient gas at a constant sample flow from the patient's airway and analyzes it with a CO₂ sensor built into the CO₂ module.

WARNINGS

- DO NOT position the sensor cables or tubing in any manner that may cause entanglement or strangulation. Support the carbon dioxide monitoring system airway adapter to prevent stress on the ET tube.
- Reuse, disassembly, cleaning, disinfecting or sterilizing the single patient use cannula kits and on-airway adapters may compromise functionality and system performance leading to a user or patient hazard. Performance is not guaranteed if an item labeled as single patient use is reused.
- Inspect the sidestream on-airway adapters and sidestream sampling kits for damage prior to use. DO NOT use the sidestream on- airway adapters and sidestream sampling kits if they appear to be damaged or broken.
- Replace the sidestream on-airway adapters and sidestream sampling kits if excessive secretions are observed.
- Monitor the CO₂ check waveform (Capnogram). If you see changes or abnormal appearance the patient and the sampling line. Replace line if needed.
- DO NOT apply excessive tension to any cable.
- DO NOT use device on patients that can not tolerate the withdrawal of 50 ml/min +/-10 ml/min from the airway or patients that can not tolerate the added dead space to the airway.
- DO NOT connect the exhaust tube to the ventilator circuit.
- DO NOT stick appendage into sample receptacle.
- Always insert sample cell before inserting the on-airway adapter into the ventilated

circuit.

- Always remove the on-airway adapter from the ventilated circuit before removing the sample cell.
- Nitrous oxide, elevated levels of oxygen, helium, Xenon, halogenated hydrocarbons, and barometric pressure can influence the CO₂ measurement.

ABBREVIATIONS AND TERMINOLOGY

EtCO ₂	End tidal carbon dioxide
INSP CO ₂	Inspired minimum CO ₂
AWRR	Air-way respiration rate
BARO	Barometric Pressure

ZEROING THE CO2 MODULE

The sample cell zero allows the CO_2 Module to adjust to the optical characteristics of the sample cell only when requested.

For optimal accuracy, a CO_2 Module zero should be performed whenever the CO_2 Module is connected to the Patient Monitor.

Before performing a CO_2 Module zero, the CO_2 Module should be removed from the Patient Monitor and the airway adapter type to be used in the circuit should be inserted into the CO_2 Module. Care should be taken ensure that the airway adapter is clear of any residual CO_2 gas. The maximum elapsed time for a CO_2 Module zero is 30 seconds. The typical time for a zero is 15 - 20 seconds.

Several CO_2 Module conditions may also request that a zero be performed. These requests stem from changes in the airway adapter that may indicate that the sensor is not in optimal measuring condition. When this occurs, the airway adapter should be checked to ensure optical occlusions such as mucus have not obscured the adapter window. If occlusions are found, the airway adapter should be cleaned or replaced.

NOTE:

- System does not allow adapter zero for 20 seconds after the last breath is detected.
- System does not allow adapter zero if temperature is not stable.
- An adapter zero cannot be performed if a sample cell is not connected to the module.

PATIENT AND TUBING PREPARATION

1. MODULE MOUNTING

a. Put the CO_2 module into the bracket of the rear panel of the monitor.

b. Check that monitor is switched off. Insert the plug of CO_2 sensor into the corresponding sensor socket marked with **EtCO₂** icon on the left panel of monitor.

WARNING: Don't hot plug $EtCO_2$ module, that is make sure that the TRANQUILITY II is powered off before Insert the connector of CO_2 sensor into $EtCO_2$ socket. Otherwise the CO_2 module may be damaged by power supply from $EtCO_2$ socket of TRANQUILITY II.

2. CONNECTING THE SAMPLE KIT

a. The sample cell of the sampling kit must be inserted into the sample cell receptacle of the CO_2 Module as shown in following figure. A "click" will be heard when the sample cell is properly inserted.

b. Connect the CO₂ tubing to Nasal and Nasal/Oral Sidestream Kits.

c. Inserting the sample cell into the receptacle automatically starts the sampling pump.

Removal of the sample cell turns the sample pump off.

d. To remove the sampling kit sample cell from the sample cell receptacle, press down on the locking tab and pull the sample cell from the sample cell receptacle.

DIRECTIONS

For use of single patient use nasal and nasal/oral sidestream kits

CAUTION: The Nasal and Nasal/Oral Cannula kits are intended for single patient use. Do NOT reuse or sterilize the cannula kit as system performance will be compromised.

1. Verify that the cannula kit is clean, dry and undamaged. Replace the cannula kit if necessary.

2. Insert the sample cell into the sample cell receptacle as shown in above figure on connecting the Sample Kit section. A "click" will be heard when properly inserted.

- 3. Perform a sample cell zero if prompted by the host system.
- 4. Place the nasal cannula kits onto the patient as shown in following figure.

- 5. Some patients are prone to mouth breathing. The Oral/Nasal sampling cannula should be used on these patients, as most, if not all of the CO_2 is exhaled through the mouth. If a standard nasal CO_2 sampling cannula is used with these patients, the $EtCO_2$ number and capnogram will be substantially lower than actual.
- 6. When using the Nasal or Oral/Nasal CO₂ sampling kits with oxygen delivery, place the cannula on the patient and then attach the oxygen supply tubing to the oxygen delivery system and set the prescribed oxygen flow.
- 7. If the oral/nasal cannula is used, the oral sampling tip may need to be trimmed to adequately fit the patient (see following figure). Place the cannula onto the patient as shown in above figure. Observe the length of the oral cannula tip. It should extend down past the teeth and be positioned in the mouth opening. Remove the cannula from the patient if the tip needs to be trimmed.

CAUTION: DO NOT cut the oral cannula tip when the cannula is on the patient. **CAUTION:** Remove the sampling kit sample cell from the CO_2 Module Inlet Port when not been use.

ETCO2 SETUP

Touch the $EtCO_2$ Waveform or Parameter Area to pop up the menu of $EtCO_2$ Setup, see graph below:

Figure 22: Tree Diagram for EtCO₂ Setup Menu

ALARM SWITCH

ON and **OFF** for choice, the factory–set is **ON**. When the choice is ON, the alarm is activated; when the choice is OFF, the alarm indicator will not light, the relative alarm parameter will not flash and relative parameter area will appear an icon of

ETCO2 ALARM HIGH

The range is $20 \sim 100$ mmHg, and the factory-set is 60 mmHg.

ETCO2 ALARM LOW

The range is $10 \sim 95$ mmHg, and the factory-set is 15 mmHg.

AWRR ALARM HIGH

The range is $10 \sim 150 \text{ mmHg}$, and the factory-set is 30 mmHg.

AWRR ALARM LOW

The range is $5\sim$ 100 mmHg, and the factory-set is 5 mmHg. The single-step adjustable length of alarm limit above is 5 mmHg.

ASPHYXIA DELAY

This setting is used to set the no breaths detected time-out. This time-out is the time period in seconds following the last detected breath at which the CO2 module will signal no breaths detected. The monitor will alarm if the patient has stopped breathing for longer than the preset apnea time.

The setting range is $10\sim60$ seconds, and the factory-set is 10 seconds.

ETCO2 UNIT

mmHg, kPa or percent (%), the factory -set is mmHg.

WAVEFORM SCALE

Use this setting to adjust the amplitude measurement (size) of the displayed EtCO2 waveform scale manually.

There are two items for choice: $0 \sim 75$ mmHg, $0 \sim 150$ mmHg.

FILL IN WAVEFORM

Use this setting to fill in the bottom portion of the waveform on any channel of the display; the "fill in" can be canceled by choosing NO item.

SWEEP SPEED

From 12.5mm/s and 25mm/s for choice, the factory-set is 12.5mm/s.

SWEEP COLOR

From White, Gray, Red, Yellow, Green, Cyan, Blue, and Magenta for choice, the default-set is Cyan.

ETCO2 PERIOD

This setting is used to set the calculation period of the $EtCO_2$ value. The end-tidal CO_2 value is the highest peak CO_2 value of all end of expirations (end of breaths) over the selected time period. If less than two breaths exist in the selected time period, the value will be the maximum $EtCO_2$ value for the last two breathes.

This setting has 1 breath, 10 seconds and 20 seconds for choice, the factory-set is 1 breath.

ZERO SETUP

Zero steps refer to "Zeroing the CO_2 Module" section detailed.

Complete the zero procedure by press "**Start Zeroing**" item. During zeroing, a message of "EtCO₂ Zero Started" will be display on the message area.

ZERO GAS TYPE

NOTE: During the CO_2 module warmup period after the monitor is powered on, the monitor will perform an automatic zero calibration. The maximum elapsed time for a CO_2 Module zero is 30 seconds. The typical time for a zero is 15 – 20 seconds.

When performing a zero on room air, this setting should be set to room air (the default). Only change to nitrogen (N_2) when performing a zero on 100% N_2 gas. This is provided for use in a laboratory environment.

ADVANCED SETUP

Pick "ADVANCED SETUP" item to call up the related menu:

Figure 23: Tree Diagram for EtCO₂ Advanced Setup

SET GAS COMPENSATIONS

The measurement of CO_2 is affected by temperature, pressure, and gas compensations. The barometric pressure as well as the presence of O_2 , N_2O , helium, and anesthetic agents in the gas mixture needs to be compensated for by the CO_2 module in order to achieve its stated accuracy. The instrument settings for these parameters should be set when initially connecting to the CO_2 module and whenever there is a change in the conditions at the patient airway.

In the CO_2 module, the temperature of the gas in the airway also effects the CO_2 measurement. It is necessary to adjust the instrument setting for the gas temperature to achieve the maximum accuracy for the CO_2 module.

OXYGEN COMPENSATION

The setting range is $0\sim$ 100 %. The factory–set is 16 %.

BALANCE GAS

There are room air, N_2O and Helium items to choose.

ANESTHETIC AGENT

Use this setting to correct for the compensation of the gas mixture administered to the patient. Anesthetic agent is ignored when the balance gas is set to helium. The setting range is $0.0 \sim 20.0$ %. The factory –set is 0.0 %.

[NOTE]

At 700mmHg of pressure, the correct CO₂ value is 35.0 mmHg.

BAROMETRIC PRESSURE

This setting is used to set current Barometric Pressure. The setting range is $400 \sim 850$ mmHg. The factory –set is 760 mmHg.

GAS TEMPERATURE

This setting is used to set temperature of the gas mixture. This setting is useful when bench testing using static gasses where the temperature is often room temperature or below.

The setting range is $0 \sim 50$ act diffye-set is 35 °C.

CALIBRATION

No routine user calibration required.

Safety lock-outs:

- System does not allow sample cell zero for 20 seconds after the last breath is detected.
- System does not allow sample cell zero if temperature is not stable.
- An adapter zero cannot be performed if a sample cell is not connected to the module.

STATUS/ERROR MESSAGES

Messages	Descriptions
Sensor Off	The CO ₂ sensor is not connected
Sensor Warm Up	One of the following conditions exist:
	Sensor under temperature
	Temperature not stable
	Source Current unstable
Sensor Over Temp	Make sure sensor is not exposed to extreme heat (heat lamp, etc.). If error persists, return sensor to factory for servicing.
Sensor error	Check that the sensor is properly plugged in. Reinsert or reset the sensor if necessary. If error persists, return sensor to factory for servicing.
Sensor Zeroing	A zero is currently in progress.
Zero Required	To clear, check airway adapter and clean if necessary. If this
	does not correct the error, perform an adapter zero. If you must
	adapter zero more than once, a possible hardware error may
	exist.
Check Sampling Line	To clear, clean if sampling line mucus or moisture is seen. If
	the sampling line is clean, perform a zero.
CO ₂ Out of Range	The value being calculated is greater than the upper CO2 limit (150 mmHg, 20.0 kPa, or 19.7 %). The maximum value output is the upper CO_2 .
Check Airway	To clear, clean airway adapter if mucus or moisture is seen. If
Adapter	the adapter is clean, perform a zero.
Pump Life Exceed	The manufacturer stated pump life has been exceeded. Service
	may be required if Pneumatic System Error is present and can
	no longer be cleared.
Sensor Setup	The CO_2 sensor is setting process.
EtCO ₂ Zero Error: Sensor Not Ready.	The CO ₂ sensor is not ready for a EtCO ₂ Zero
EtCO ₂ Zero Error:	Breaths have been detected by the CO ₂ module within the last
Breath Detected.	20 seconds while a CO ₂ module zero was attempted.

MAINTENANCE AND CLEANING

SCHEDULE

The CO_2 Module flow rate accuracy should be verified by direct measurement using a calibrated flow meter every 12 months.

CLEACING

Cleaning the CO₂ Module case, Cable and connector:

1. Use a cloth dampened with isopropyl alcohol 70%, a 10% aqueous solution of sodium hypochlorite (bleach), a 2% gluteraldehyde solution, ammonia, mild soap or disinfectant spray cleaner such as Steris Coverage® Spray HB.

2. Wipe down with a clean water-dampened cloth to rinse and dry before use. Make certain that the sensor windows are clean and dry before reuse.

[NOTE]

DO NOT immerse or sterilize the CO₂ Module.

Cleaning the Sidestream On-Airway Adapters and Sidestream Sampling Kits: Sidestream on-airway adapters and sidestream sampling kits are single patient use. Treat in accordance with hospital protocols for handling single patient use devices.

IBP MONITORING (OPTION)

- THEORY OF OPERATION
- INTRODUCTION
- WARNING
- PREPARATION FOR MONITORING
- INSTRUCTIONS FOR USE OF TRANSDUCER MONITORING KIT
- IBP SETUP
- SET TRANSDUCER ZERO
- PROMPT MESSAGE
- MAINTAINENCE AND CLEANING

THEORY OF OPERATION

There are two ways of measuring blood pressure: Direct (Invasive Pressure or IP) and Indirect (Non-invasive Blood Pressure or NIBP) method. The indirect method uses simple equipment but provides limited physiological information. The direct or invasive method (IP) provides accurate pressure measurements in regions of the cardiovascular system that are inaccessible to the indirect method.

To measure blood pressure by the invasive method, a catheter is inserted in a blood vessel and taken to the point of interest. The catheter has a transducer that provides electrical signals, which are then processed and analyzed by the monitor. Measurement of blood pressure by the invasive method gives the systolic (maximum), diastolic (minimum) and means pressure.

The invasive pressure range is from -30 to 300 mmHg, allowing the operator to use the monitor for measuring arterial pressure, pulmonary artery pressure and central venous pressure.

INTRODUCTION

When an invasive pressure is selected to be displayed on a waveform channel, the monitor will default to the label IBP1 or IBP2, which indicates a general "Invasive Pressure". In addition, the monitor allows the selection of a pressure channel label that more clearly identifies a measurement. The choices for invasive arterial pressures are:

- ART Arterial Blood Pressure
- PA Pulmonary Artery Pressure
- CVP Central Venous Pressure
- RAP Right Arterial Pressure
- LAP Left Arterial Pressure
- ICP Intracranial Pressure

WARNING

- For invasive pressure monitoring, routinely inspect the catheter and/or pressure line for leaks after zeroing. Always follow the pressure transducer/catheter manufacturer's use recommendations.
- Always zero the pressure transducer(s) prior to patient use.
- Non-physiological pulsatile invasive pressure waveforms (e.g., such as found during intra-aortic balloon pump use) can lead to inaccurate blood pressure readings. If questionable value is observed, re-check patient's pressures by alternate means before administering medication or therapy.
- The operator should avoid contact with the conductive parts of the appurtenance when being connected or applied.
- Disposable IBP transducer or domes should not be reused.

- Use only the pressure transducer designated by our company.
- Verify transducer cables fault detection before beginning of monitoring phase. Unplug the transducer of the channels from the socket, the screen will display the error message and audible alarm is activated, the other channel is the same.
- If any kind of liquid, other than solution to be infused in pressure line or transducer, is splashed on the equipment or its accessories, or may enter the transducer or inside the monitor, contact the hospital service center immediately.
- If there are air bubbles in the pressure line or the transducer, you should flush the system with solution to be infused.
- Calibrate the instrument either whenever a new transducer is used, or as frequently as indicated by your hospital procedures policy.

PREPARATION FOR MONITORING

Preparing for invasive pressure monitoring requires the following steps:

- Installation of Transducer Cable
- Kit Set Up
- Purging Air from the Lines
- Zeroing, Leveling and Calibration
- Connecting monitoring system to patient

INSTRUCTIONS FOR USE OF TRANSDUCER MONITORING KIT

INSTALLATION OF TRANSDUCER CABLE

- 1. Insert the plug of IBP transducer cable into the corresponding sensor socket on the left panel of monitor and check that monitor is switched on.
- 2. Prepare the pressure tubing and transducer by flushing through the system with normal saline solution. Ensure the system is free of air bubbles.
- 3. Connect that patient catheter to the pressure line; making sure that there is no air present in the catheter of pressure line.
- 4. Position the transducer so that it is the level with the patient's heart, approximately midaxillary line.
- 5. Check if you have selected the correct lable.
- 6. Zero the transducer.

KIT SET UP

This section detail refers to relate to content detailed of instructions for use for disposable transducer monitoring kit.

PATIENT MOUNT

This section detail refers to relate to content detailed of instructions for use for disposable transducer monitoring kit.

IBP SETUP

Touch the IBP1 or IBP2 Waveform or Parameter Area to pop up the menu of IBP Setup, see below:

Figure 24: Tree Diagram for IBP1 or IBP2 Setup Menu

ALARM SWITCH

ON and OFF for choice, the factory–set is ON. When the choice is ON, the alarm is activated; when the choice is **OFF**, the alarm indicator will not light, the relative alarm parameter will not flash and relative parameter area will appear an icon of .

PRESSURE UNIT

mmHg and KPa for choice, the factory-set is mmHg.

NOTE: The pressure unit is displayed in accord with setup of NIBP menu.

SET LABEL

ART, PA, CVP, RAP, LAP and ICP are selectable.

SWEEP SPEED

From 12.5mm/s, 25mm/s or choice, the factory-set is 25mm/s.

SWEEP COLOR

From White, Gray, Red, Yellow, Green, Cyan, Blue, and Magenta for choice, the default-set is Red.

WAVEFORM SCALE

Pick "waveform scale" to call up the following menu:

Figure 25: Window for IBP1 or IBP2 Wave Scale

The waveform and corresponding scale values will be displayed in the IBP waveform area. These scales can be set according to the table given below:

HI: IBP value of High Limit scale;

LO: IBP value of Low Limit scale.

Labels	High	Low
ART	50-300	0-100
PA	20-150	-10-50
CVP	0-150	-10-150
RAP	0-150	-10-150
LAP	0-150	-10-150
ICP	0-150	-10-150

ALARM SETUP

Press the alarm setup item to pop up the IBP1 or IBP2 alarm setup menu as below:

Figure 26: Window for IBP1 or IBP2 Alarm Setup

The alarm setup range for high or low is from 0 to 300mmHg for ART label. The factory-set for high limit is 150 mmHg. The factory-set for low limit is 75 mmHg.

The alarm setup range for high or low is from -10 to 120mmHg for PA label. The factory-set for SYS high limit is 90 mmHg. The factory-set for SYS low limit is 60

mmHg. The factory-set for DIA high limit is 75 mmHg. The factory-set for DIA low limit is 45 mmHg.

The alarm setup range for high or low is from -10 to 40mmHg for CVP, RAP, LAP and ICP label. The factory-set for MAP high limit is 30 mmHg. The factory-set for MAP low limit is 10 mmHg.

SET TRANSDUCER ZERO

After the system has been primed and mounted, zero the transducer. The following procedure should be completed periodically.

1. Turn zero reference stopcock "off" to the patient and remove yellow nonvented cap from the side port that opens the zero reference stopcock to air.

[NOTE]

The air-fluid interface of the zero reference stopcock should be at or near the right atrial (mid-axillary) level.

2. Open the IBP Setup menu and then choose the "Zero IBP". You can Zero IBP1 and IBP2 at the meantime.

Upon connection of an invasive pressure transducer, the monitor will seek a steady pressure for zeroing. A sequence of on-screen status messages will be displayed.

- a. As soon as the power switch is turned on, "SENSOR OFF!" will be displayed on the screen in the message highlight area.
- b. When an invasive pressure transducer is inserted into the IP receptacle on the left side panel of the monitor, the initial waveform may be visible immediately based upon the most recently selected scale. The waveform scale numbers are not shown until transducer is zeroed. If the pressure transducer or interconnect cable is defective, the on-screen message "SENSOR OFF, UNABLE TO ZERO!" will remain on the screen. In this case, try another transducer or another cable.
 - 3. Turn zero reference stopcock "off" to the side port. Replace nonvented yellow cap.

[NOTE]

- It is the responsibility for the user to ensure that a zero procedure has recently been done on the transducer, otherwise there will be on recent, valid zero value for the instrument to use, which may result in inaccurate measurement results.
- Turn off patient 3-way stopcock before you start the zero procedure.
- The transducer must be vented to atmospheric pressure before the zero procedure.

PROMPT MESSAGE

Messages	Descriptions
OVERANGE, ZERO FAIL!	Make sure that the stopcock is vented to
	atmosphere. If the problem persists, contact
	service representative if necessary.
TIMED OUT, ZERO FAIL!	Make sure that monitor is not in DEMO mode.
	Contact service representative if necessary.
SENSOR OFF, UNABLE TO	Make sure that channel 1 or channel 2's
ZERO!	transducer is not off, and then proceeds zeroing.
ZERO IN PROCESS!	A zero is currently in progress.
ZERO OK!	The zero procedure is completed.

MAINTAINENCE AND CLEANING

Make sure that the device is switched off and disconnected from the power cable before cleaning the monitor or the transducer.

The disposable transducers or caps is a single use kit, must not be re-sterilized or re-used.

PHASEIN IRMA™ MAINSTREAM PROBE

INTRODUCTION

PHASEIN IRMA[™] mainstream multi-gas probe is intended for gas monitoring of adults, pediatric and infant patients in anesthesia, intensive care and emergency care.

The IRMA probe comprises a state-of-the-art, single path, nine-channel non-dispersive infrared (NDIR) gas bench, a barometric pressure sensor, a power regulator, a CPU and a RS-232 digital interface. The unit weighs less than 25 g.

The probe is available in various configurations for different clinical applications. Concentrations of carbon dioxide, nitrous oxide, Halothane, Enflurane, Isoflurane, Sevoflurane and Desflurane in different combinations are determined together with derived parameters such as respiration rate, waveform data and inspired/expired concentrations of all gases.

The IRMA probe snaps in place on the IRMA airway adapter that includes PHASEIN's XTP[™] windows. The airway adapter is inserted between the endotracheal tube and the breathing circuit, and the gas measurements are obtained through the XTP windows in the sides of the adapter.

Running on a standard low voltage DC, the IRMA probe is designed with portability in mind and has low power consumption, typically less than one watt. It has been specially designed to be extremely easy to integrate in any host device for display of real time and derived breathing gas data.

The IRMA main stream multi-gas probe is intended to be connected to other medical devices for display of real time and derived monitoring data of CO_2 , N_2O , and the

anesthetic agents Halothane, Enflurane, Isoflurane, Sevoflurane and Desflurane. It is intended to be connected to a patient breathing circuit for monitoring of inspired/expired gases during anesthesia, recovery and respiratory care. It may be used in the operating suite, intensive care unit, patient room and emergency medicine settings for adult, pediatric and infant patients.

It is not intended to be used as the only means of monitoring a patient. It shall always be used in combination with other vital signs monitoring devices and/or professional human judgments of patient condition. The IRMA probe is intended to be used by trained and authorized health care professionals only.

SAFETY

WARNINGS

- DO NOT use the IRMA Adult/Pediatric airway adapter with infants as the adapter adds 6 ml dead space to the patient circuit.
- Replace the adapter if rainout/condensation occurs inside the airway adapter.
- Use only PHASEIN manufactured IRMA airway adapters.
- DO NOT use the IRMA Infant airway adapter with adults as this may cause excessive flow resistance.
- The IRMA probe is not intended to be in patient contact.
- Incorrect probe zeroing will result in false gas readings.
- The IRMA probe is intended for use by authorized and trained medical personnel only.
- The IRMA probe must not be used with flammable anesthetic agents.
- Disposable IRMA airway adapters shall not be reused. Reuse of the single use adapter can cause cross infection.
- Used airway adapters shall be disposed of in accordance with local regulations for medical waste.
- The IRMA probe is intended only as an adjunct in patient assessment. It must be used in conjunction with other assessments of clinical signs and symptoms.
- DO NOT place the IRMA airway adapter between the endotracheal tube and an elbow as this may allow patient secretions to block the adapter windows and result in incorrect operation.
- To keep secretions and moisture from pooling on the windows, always position the IRMA probe in a vertical position with the LED pointing upwards.
- DO NOT use the IRMA airway adapter with metered dose inhalers or nebulized medications as this may affect the light transmission of the airway adapter windows.

CAUTIONS

- Never sterilize or immerse the IRMA probe in liquid.
- DO NOT autoclave the devices as this will damage them.
- DO NOT apply tension to the sensor cable.
- DO NOT operate the device outside the temperature environment
- (U.S.): Federal law restricts this device to sale by or on the order of a physician.

SYSTEM ASSEMBLY INSTRUCTION

SET-UP

1. Plug the IRMA connector into the Patient Monitor EtCO₂/Gas socket and switch the power on.

2. Snap the IRMA probe on top of the IRMA airway adapter. It will click into place when properly seated.

3. A green LED indicates that the IRMA probe is ready for use.

4. Connect the 15 mm male connector of IRMA/airway adapter to the breathing circuit Y-piece.

5. Connect the 15mm female connector of IRMA/airway adapter to the patient's endotracheal tube.

Alternatively, connect an HME (Heat Moisture Exchanger) between the patient's endotracheal tube and the IRMA probe. Placing an HME in front of the IRMA probe protects the airway adapter from secretions and effects of water vapor and eliminates the need of changing the adapter. It allows free positioning of the IRMA probe as well.

6. Always position the IRMA probe with the status LED pointing upwards unless the IRMA probe is protected with an HME

PLACEMENT OF IRMA PROBE

When connecting IRMA probe to an infant patient circuit, it is important to avoid a direct contact between the IRMA probe and the infant's body.

If, for whatever the reason, the IRMA probe is in direct contact with any parts of the infant's body, an insulation material shall be placed between the IRMA probe and the body.

WARNING: The IRMA probe is not intended to be in patient contact

PRE-USE CHECK

Prior to connecting the IRMA airway adapter to the breathing circuit, verify gas readings and waveforms on the monitor before connecting the airway adapter to the patient circuit. Perform the tightness check of the patient circuit with the IRMA probe snapped on the IRMA airway adapter.

ZEROING PROCEDURE

WARNING: Incorrect probe Zeroing will result in false gas readings.

In order to secure high precision of the IRMA probe measurements the following zeroing recommendations should be followed.

Zeroing is performed by snapping a new IRMA airway adapter onto the IRMA probe, without connecting the airway adapter to the patient circuit, and then using TRANQUILITY II to transmit a Zero reference command to the IRMA probe.

Special care should be taken to avoid breathing near the airway adapter before or during the Zeroing procedure. The presence of ambient air $(21\% O_2 \text{ and } 0\% CO_2)$ in the IRMA airway adapter is of crucial importance for a successful Zeroing. Always perform a pre-use

check after zeroing the probe.

IRMA CO₂ probes:

Zeroing needs to be performed ONLY when an offset in gas values is observed, or when an unspecified accuracy message is displayed.

Allow 10 seconds for warm up of the IRMA CO₂ probe after power on and after changing the IRMA airway adapter before proceeding with the Zeroing Procedure. The green LED on the probe will be blinking for approximately 5 seconds while zeroing is in progress.

IRMA AX+ probes:

Zeroing should be performed **every time the IRMA airway adapter is replaced,** or whenever an offset in gas values or an unspecified gas accuracy message is displayed. Allow 30 seconds for warm up of the IRMA AX+ probes after power on and after changing the IRMA airway adapter before proceeding with the Zeroing Procedure. The green LED on the probe will be blinking for approximately 5 seconds while zeroing is in progress.

ZERO BY MONITOR

After install the PHASEIN gas module, and Click the Anesthetic Agent Waveform and Parameter Area to pop up the menu of Multi-Gas Setup \rightarrow Advanced setup \rightarrow manual zero, Monitor will conduct a zero procedure and "zero in progress" message will be displayed.

ALARMS

GAS ALARM LIMIT

Gas type	HIGH (%)	LOW(%)
FIAGT	5	0
ETAGT	5	0
FICO ₂	0.5	0
ETCO ₂	8	2
FIN ₂ O	100	0
FIO ₂	100	18
ETO ₂	100	5

STATUS LED ON IRMA PROBE

Status	Meaning
Steady green light	System OK
Blinking green light	Zeroing in progress
Steady blue light 1)	Anesthetic agent present
Steady red light	Sensor error
Blinking red light	Check adapter

[NOTE]: 1) Valid for IRMA AX++ probes only

CLEANING

The IRMA probe can be cleaned using a cloth moistened with maximum 70% ethanol or maximum 70% isopropyl alcohol. Remove the disposable IRMA Airway Adapter prior to cleaning the IRMA probe.

Caution: Never sterilize or immerse the IRMA probe in liquid.

MAINTENANCE

Gas readings should be verified at regular intervals with a reference instrument or with calibration gas. The recommended interval is once every year.

PHASEIN ISA™ SIDESTREAM ANALYZER

INTRODUCTION

The ISA product family consists of three types of sidestream gas analyzers (ISA CO_2 , ISA AX+ and ISA OR+), which are intended to be connected to TRANQUILITY II Patient Monitor for measuring breath rate and the following breathing gases: ISA CO_2 : CO_2

ISA AX+: CO_2 , N_2O , Halothane, Isoflurane, Enflurane, Sevoflurane and Desflurane ISA OR+: CO_2 , O_2 , N_2O , Halothane, Isoflurane, Enflurane, Sevoflurane and Desflurane

ISA CO₂, ISA AX+ and ISA OR+ are intended to be connected to a patient breathing circuit for the monitoring of inspired/expired gases during anesthesia, recovery and respiratory care. The intended environment is the operating suite, intensive care unit and patient room. ISA CO₂ is also intended to be used in road ambulances. The intended patient population is adult, pediatric and infant patients.

[NOTE 1]: An ISA sidestream gas analyzer should never be used as the only means of monitoring a patient.

[NOTE 2]: An ISA sidestream gas analyzer shall only be connected to medical devices approved by PHASEIN.

Patents

PHASEIN AB holds the following patents regarding products described in this manual: SE519766; SE519779; SE523461; SE524086. Other patents are pending.

Trademarks

PHASEIN IRMA[™], PHASEIN ISA[™], PHASEIN XTP[™], Sigma Multigas Technology[™], LEGI[™], Nomoline[™], IRMA EZ Integrator[™], PHASEIN Gas Master[™] and PHASEIN Gas Master[™] are trademarks of PHASEIN AB.

SAFETY

CLASSIFICATION

- According to the degree of safety of application in the presence of FLAMMABLE ANAESTHETIC MIXTURE WITH AIR, OR WITH OXYGEN OR NITROUS OXIDE: The ISA is not suitable for use in the presence of FLAMMABLE ANAESTHETIC MIXTURE WITH AIR, OR WITH OXYGEN OR NITROUS OXIDE.
- According to the degree of protection against harmful ingress of water:IPX4
- According to sterility: The ISA system contains no sterile parts.
- According to the model of operation: CONTINUOUS OPERATION
- According to the degree of protection against electric shock:
- Nomoline Family sample lines are classified as DEFIBRILLATION PROOF TYPE BF APPLIED PART
- The combination of TRANQUILITY II and ISA shall be considered a ME SYSTEM.

WARNINGS

- The ISA sidestream gas analyzer is intended for use by authorized and trained medical personnel only.
- Use only Nomoline sampling lines manufactured by PHASEIN.
- The ISA sidestream gas analyzer must not be used with flammable anesthetic agents.
- Carefully route the sampling line to reduce the risk of patient entanglement or strangulation.
- DO NOT re-use disposable sampling lines.
- DO NOT lift the ISA/TRANQUILITY II by the sampling line as it could disconnect from the ISA/ TRANQUILITY II >, causing the ISA/ TRANQUILITY II to fall on the patient.
- Used disposable sampling lines shall be disposed of in accordance with local regulations for medical waste.
- DO NOT use adult/pediatric type sampling line configurations with infants, as this may add dead space to the patient circuit.
- DO NOT use infant type sampling line configurations with adults, as this may cause excessive flow resistance.
- DO NOT use the ISA sidestream gas analyzer with metered-dose inhalers or nebulized medications as this may clog the bacteria filter.
- Check that the gas sample flow is not too high for the present patient category.
- Since a successful zeroing requires the presence of ambient air (21% O₂ and 0% CO₂) in the gas analyzer, ensure that the ISA is placed in a well ventilated place. Avoid breathing near the ISA sidestream gas analyzer before or during the zeroing procedure.
- The Nomoline sampling line and its interfaces are non-sterile devices. To avoid damage, do not autoclave any part of the sampling line.
- Never sterilize or immerse the ISA sidestream gas analyzer in liquid.
- Measurements can be affected by mobile and RF communications equipment. Make sure that the ISA sidestream gas analyzer is used in the electromagnetic environment specified in this manual.
- ISA sidestream gas analyzer is intended only as an adjunct in patient assessment. It must be used in conjunction with other assessments of clinical signs and symptoms.
- Replace the sampling line if the sampling line input connector starts flashing red, or a Nomoline occlusion message is displayed on the TRANQUILITY II
- No modification of this equipment is allowed without authorization of the manufacturer. If this equipment is modified, appropriate inspection and testing must be conducted to ensure continued safe operation.
- ISA sidestream gas analyzers are not designed for MRI environments.
- During MRI scanning, the TRANQUILITY II must be placed outside the MRI suite.
- Use of high frequency electrosurgical equipment in the vicinity of the ISA/TRANQUILITY II may produce interference and cause incorrect measurements.

- DO NOT use external ambient cooling of the ISA device.
- DO NOT apply negative pressure to the Nomoline (i.e. by a syringe) to remove condensed water.
- Too strong positive or negative pressure in the patient circuit might affect the sample flow.
- Strong scavenging suction pressure might affect the sample flow.
- Exhaust gases should be returned to the patient circuit or a scavenging system.
- Always use a bacteria filter on the evac side if sampled gas is intended to be re-breathed.
- DO NOT place the ISA gas analyzer in any position that might cause it to fall on the patient.

CAUTIONS

- The ISA "plug-in and measure" analyzers should be securely mounted in order to avoid the risk of damage to the ISA.
- DO NOT apply tension to the ISA sidestream gas analyzer cable.
- DO NOT operate the ISA sidestream gas analyzer outside the specified operating temperature environment.
- (US Only) Caution: Federal law restricts this device to sale by or on the order of a licensed healthcare practitioner.

ANALYZER SYSTEM SET-UP

1. Securely mount the ISA analyzer.

- 2. Connect the ISA analyzer interface cable to the TRANQUILITY II Patient Monitor.
- 3. Connect a Nomoline Family sampling line to the ISA analyzer input connector.

4. Connect the gas sample exhaust port to a scavenging system or return the gas to the patient circuit to prevent pollution of the operation room when N_2O and/or anesthetic agents are being used.

- 5. Power up the TRANQUILITY II Patient Monitor.
- 6. A green LED indicates that the ISA analyzer is ready for use.
- 7. Perform a pre-use check as described in section "Pre Check".

PRE-USE CHECK

Before connecting the Nomoline sampling line to the breathing circuit, do the following:

- 1. Connect the sampling line to the ISA gas inlet connector (LEGI)
- 2. Check that the LEGI shows a steady green light (indicating that the system is OK)
- 3. For ISA AX+ module with O_2 option fitted:

Check that the O_2 reading on the monitor is correct (21%).

- 4. Breathe into the sampling line and check that valid CO₂ waveforms and values are displayed on the TRANQUILITY II Patient Monitor.
- 5. Occlude the sampling line with a fingertip and wait for 10 seconds.
- 6. Check that an occlusion alarm is displayed and that the LEGI shows a flashing red light.
- 7. If applicable:
- Perform a tightness check of the patient circuit with the sampling line attached.

CONSUMABLE

SAMPLING

A sidestream gas analyzer continuously removes a gas sample flow from the respiratory circuit, for example a nasal cannula, a respiratory mask or the Y-piece of an intubated patient. The gas sample is fed through a sampling line to the gas analyzer. The sampled gas is usually warm and humid, and cools down in contact with the wall of the sampling line. Water therefore condenses in form of droplets on the inner wall of the sampling line. These droplets could potentially occlude the sampling line and interfere with the gas measurement.

THE NOMOLINE FAMILY

To overcome the shortfalls of current gas sampling solutions, the Nomoline Family sampling lines have been developed for the ISA sidestream gas analyzers.

Unlike traditional solutions that remove water vapor and collect water in a container, the Nomoline Family sampling lines incorporates a unique water separation (NO Moisture) section, which removes condensed water. The NOMO section also has a bacteria filter which protects the gas analyzer form water intrusion and cross contamination.

The Nomoline Family sampling lines are specially designed for 50 ml/min low sample flow applications. The Nomoline Family sample lines have a very low dead space that results in an ultra-fast rise time, making measurements of CO_2 , N_2O and anesthetic agents possible even at high respiratory rates. ISA sidestream gas analyzers are therefore suitable for adult, pediatric and infant patients.

The Nomoline Family sampling lines are available in the following versions:

(The Nomoline Family sampling lines; Nomoline with male Luer Lock connector, Nomoline Airway Adapter Set with integrated airway adapter and the Nomoline Adapter with female Luer Lock connector.)

The Nomoline Airway Adapter Set with integrated airway adapter can be used with intubated patients.

The Nomoline with a male Luer Lock type connector is compatible with any normal configuration that uses a female Luer Lock connector. When connecting to a T-adapter, be sure to use a PHASEIN T-adapter that samples the gas from the center of the T-adapter (see below).

(For optimal water handling, always use T-adapters with the sampling point in the center of the adapter, as shown to the left in the figure above.)

The Nomoline Adapter with female Luer Lock connector connects to a standard male Luer to Luer sample line (Nomo Extension) as well as to different kinds of third-party cannulas for oral and nasal sampling. Combining the Nomoline Adapter with the Nomo Extension and T-adapter results in a similar product as the Nomoline Airway Adapter Set (see below).

(Combining Nomoline Adapter with the Nomo Extension and T-adapter results in a similar product as the Nomoline Airway Adapter Set.)

(If using third-party sample tubes or cannula, make sure that the inner diameter does not exceed 1 mm since this will increase the ISA's total system response time.)

[NOTE]: Using sample tubes or cannula with larger inner diameter than 1 mm will increase the response time of ISA's total system.

[WARNING]: DO NOT apply negative pressure to remove condensed water from the Nomoline Family sampling line.

[WARNING]: DO NOT use the ISA gas analyzer with metered-dose inhalers or nebulized medications as this may clog the bacteria filter.

[WARNING]: DO NOT apply negative pressure to remove condensed water from the Nomoline Family sampling line.

[WARNING]: Dispose nomoline family sampling lines in accordance with local regulations for biohazardous waste.

[WARNING]: Use only airway T-adapters with the sampling point in the center of the adapter.

[WARNING]: DO NOT re-use disposable single-patient use Nomoline Family sampling lines due to the risk of cross contamination.

[WARNING]: DO NOT sterilize or immerse Nomoline Family sampling lines in liquid.

[WARNING]: DO NOT use T-adapter with infants, as this adds 7 ml dead space to the patient circuit.

[WARNING]: Do only use sample lines intended for anesthetic agents if N2O and/or anesthetic agents are being used.

REPLACEMENT OF NOMOLINE AND NOMOLINE AIRWAY ADAPTER SET

The Nomoline and Nomoline Airway Adapter Set are single-patient use products. They should be replaced according to good clinical practice or when an occlusion message appears. Occlusion occurs when the sample flow is too low. This is indicated by a flashing red LEGI together with a message on TRANQUILITY II.

REPLACEMENT OF NOMOLINE ADAPTER

The Nomoline Adapter is a multiple-patient use product.

The Nomoline Adapter should be replaced according to good clinical practice or when an occlusion message appears. Occlusion occurs when the sample flow is too low. This is indicated by a flashing red LEGI together with a message on TRANQUILITY II.

REPLACEMENT OF T-ADAPTER AND NOMO EXTENSION

The T-adapter and Nomo Extension are single-patient use products.

They should be replaced according to good clinical practice or when an occlusion message appears. Occlusion occurs when the sample flow is too low. This is indicated by a flashing red LEGI together with a message on TRANQUILITY II.

Steady red light	Sensor error
Blinking red light	Check sampling line

AUTOMATIC ZEROING

The infrared gas analyzer needs to establish a zero reference level for the CO_2 , N_2O and anesthetic agent gas measurement. This zero calibration is here referred to as "zeroing". ISA sidestream gas analyzers perform zeroing automatically by switching the gas sampling from the respiratory circuit to ambient air. The automatic zeroing is performed every 24 hours, and takes less than 3 seconds for ISA CO_2 gas analyzers and less than 10 seconds for ISA multigas analyzers.

If the ISA sidestream gas analyzer is fitted with an oxygen sensor, the automatic zeroing will also include room air calibration of the oxygen sensor.

[WARNING]: Since a successful zeroing requires the presence of ambient air $(21\% O_2 and 0\% CO_2)$ in the gas analyzer, ensure that the ISA is placed in a well ventilated place. Avoid breathing near the ISA sidestream gas analyzer before or during the zeroing procedure.

CLEANING

The "plug-in and measure" ISA sidestream gas analyzers should be cleaned on a regular basis.

Use a cloth moistened with max 70% ethanol or isopropyl alcohol to clean the analyzer. To prevent cleaning liquids and dust from entering the ISA gas analyzer through its LEGI connector, keep the Nomoline sampling line connected while cleaning the analyzer.

[WARNING]:

- The Nomoline sampling lines are non-sterile devices. To avoid damage, DO NOT autoclave any part of the sampling line.
- Never sterilize or immerse the ISA sidestream gas analyzer in liquid.Since a successful zeroing requires the presence of ambient air (21% O₂ and 0%CO₂) in the gas analyzer, ensure that the ISA is placed in a well ventilated place. Avoid breathing near the ISA sidestream gas analyzer before or during the zeroing procedure.

MAINTENANCE

Once every year, or whenever gas readings are questionable, perform a leakage check as below and verify gas readings with a reference instrument or with calibration gas. Calibration gas can be ordered from PHASEIN AB (www.phasein.com).

LEAKAGE CHECK

1. Connect a new Nomoline sampling line with male luer lock to the ISA LEGI and check that the LEGI shows a steady green light.

2. Connect a short of silicon tubing with an inner diameter of 3/32" (2.4 mm) to the Nomoline male luer.

3. Exhale a long breath into the silicon tubing until the CO_2 concentration is greater than 4.5 vol % or 34 mmHg.

4. Quickly connect the silicon tubing tightly to the exhaust port.

5. Wait 1 minute until the CO_2 concentration has stabilized. Note the value.

6. Wait 1 minute and check that the CO_2 concentration has not decreased more than 0.4 vol% or 3 mmHg. If it has decreased more there is a major leakage in the ISA unit or in the Nomoline. DO NOT operate the ISA if there is a major leakage in the unit.

MAC (Minimum Alveolar Concentration) CACULATION

Minimum alveolar concentration (MAC) is a standard for comparing the potency of inhalation anesthetics. 1 MAC represents the end-tidal concentration of an agent (at sea level) that, in 50 percent of a tested population, prevents gross muscular movement in response to a painful, standardized stimulus.

The MAC value may be calculated and displayed by using end-tidal (Et) gas concentrations according to the following formula:

$$MAC = \frac{\% Et(AA1)}{X(AA1)} + \frac{\% Et(AA2)}{X(AA2)} + \frac{\% Et(N2O)}{100}$$

$$X(AA1)$$
 $X(AA2)$

X(AA): HAL=0.75%, ENF=1.7%, ISO=1.15%, SEV=2.05%, DES=6.0%

[NOTE]: Altitude, patient age and other individual factors are not considered in the formula above.

ADVERSE EFFECTS ON PERFORMANCE

EFFECTS OF HUMIDITY

The partial pressure and the volume percentage of CO₂, N₂O, O₂ and anesthetic agents depend on the amount of water vapor in the measured gas. The O₂ measurement will be calibrated to show 20.8 vol% at actual ambient temperature and humidity level, instead of showing actual partial pressure. 20.8 vol% O₂ corresponds to the actual O₂ concentration in room air with 0.7 vol% H₂O concentration (at 1013 hPa this equals for example 25°C and 23% RH).

The measurement of CO_2 , N_2O , and anesthetic agents (e.g. all gases measured by the IR-bench) will always show the actual partial pressure at the current humidity level.

In the alveoli of the patient, the breathing gas is saturated with water vapor at body temperature (BTPS).

When the breathing gas flows through the sampling line, the gas temperature will adapt to ambient before reaching the gas analyzer. As the NOMO section removes all condensed water, no water will reach the ISA gas analyzer. The relative humidity of the sampled gas will be about 95%.

If CO₂ values at BTPS are required, the following equation can be used:

$$EtCO_{2}(BTPS) = EtCO_{2} * \left(1 - \left(\frac{3.8}{pamb}\right)\right)$$

Where:

 $EtCO_2 = EtCO_2$ value sent from ISA [vol %]

Pamb = Ambient pressure sent from ISA [kPa]

3.8 = Typical partial pressure of water vapor condensed between patient circuit and ISA [kPa]

 $EtCO_2$ (BTPS) = $EtCO_2$ gas concentration at BTPS [vol%]

 O_2 is assumed to be room air calibrated at a humidity level of 0.7 vol% H_2O .

ANESTHETIC AGENT DISPLAY

DISPLAY

Open the PHASEIN Gas module and then choose to display AG waveform in the "Waveform Select" menu. See graph below.

SENSOR STATUS

- Sensor Off
- Check Sample Line
- Sensor error
- Zero in Progress
- Unspecified accuracy

PHYSIOLOGIC AGENT STATUS

ID: The gas module has identified an agent. In this state, the corresponding ID indicates one of the 5 anesthetic agents.

ANESTHETIC AGENT TYPE

HAL: Halothane ENF: Enflurane ISO: Isoflurane SEV: Sevoflurane DES: Desflurane

ANESTHETIC AGENT SETUP

Touch the Anesthetic Agent Waveform or Parameter Area to pop up the menu of Multi-Gas Setup, see below

Advanced Setup

Figure 27: Tree Diagram for Multi-Gas Setup Menu

ALARM SWITCH

ON and OFF for choice, the factory-set is ON. When the choice is ON, the alarm is activated; when the choice is **OFF**, the alarm indicator will not light, the relative alarm

parameter will not flash and relative parameter area will appear an icon of $\overset{\frown}{4}$.

APNEA DELAY

This setting is used to set the no breaths detected time-out. This time-out is the time period in seconds following the last detected breath at which the CO_2 module will signal no breaths detected.

The setting range is $10{\sim}60$ seconds, and the factory-set is 10 seconds.

AGENT TYPE

"Auto ID", "Halothane", "Enflurane", "Isoflurane", "Sevoflurane" and "Desflurane" for choice.

If the AAM has no "Auto ID" function, the anesthetic agent type needs to be selected manually.

WAVEFORM SCALE

"0-10%" and "0-20%" for choice, the factory-set is "0-10%". Use this setting to adjust the amplitude measurement (size) of the displayed $EtCO_2$ waveform scale manually.

WAVE FILL

Use this setting to fill in the bottom portion of the waveform on any channel of the display.

SWEEP SPEED

12.5mm/s and 25mm/s for choice, the factory-set is 12.5mm/s.

SWEEO COLOR

It provides white, red, green, cyan, blue, yellow, gray and magenta which can be chosen.

GAS UNIT SETUP

"mmHg", "kPa" and "%" for choice, the factory-set is %

ALARM SETUP

	High	Low
FI Agt	0.0-20.0 factory-set: 5.0(%)	0.0-20.0 factory-set: 0.0(%)
ET Agt	0.0-20.0 factory-set: 5.0(%)	0.0-20.0 factory-set: 0.0(%)
FI CO2	0.0-10.0 factory-set: 0.5(%)	0.0-10.0 factory-set: 0.0(%)
ET CO2	0.0-10.0 factory-set: 8.0(%)	0.0-10.0 factory-set: 2.0(%)
RR	0-100 factory-set: 30(rpm)	0-100 factory-set: 5 (rpm)
FI N2O	0-100 factory-set: 100(%)	0-100 factory-set: 0(%)
ET N2O	0-100 factory-set: 100(%)	0-100 factory-set: 0(%)
FI O2	18-100 factory-set: 100(%)	18-100 factory-set: 18(%)
ET O2	0-100 factory-set: 100(%)	0-100 factory-set: 5(%)

ADVANCED SETUP

ZERO GAS TYPE

"Scrubbed Air/N₂/O₂", "Room Air" and "100% O₂" for choice, the factory-set is "Room Air".

O2 COMPENSATIONS

The anesthetic agents in the gas mixture need to be compensated in order to achieve its stated accuracy. The instrument settings for this parameter should be set when the O_2 sensor is unconnected. But when install the O_2 sensor, this function isn't available.

STANDBY MODE

When measurements are temporarily not needed, the monitor can switch the AAM from 'Operation Mode' into 'Standby Mode'. During standby, some internal components of the module are switched off, which increases the lifetime of the module. When measurements are needed again, the device must be switched back into 'Operation Mode'. The latter transition will usually take less than 30 seconds.

ANESTHETIC AGENT MONITORING (OPTION, DRÄGER)

- THEORY OF OPERATION AND DESCRIPTIONS
- PATIENT CONNECTIONS
- ANESTHETIC AGENT DISPLAY
- ANESTHETIC AGENT SETUP
- MAC CALCULATION
- CALIBRATION

THEORY OF OPERATION AND DESCRIPTION

The Anesthetic Agent Module (AAM) incorporates the latest design techniques and solid-state technology to redefine compactness and reliability. Miniaturization and performance advancements lead to an extremely cost-effective measuring of all five relevant anesthetic agents, as well as carbon dioxide and nitrous oxide. Ingenious solid-state design means that there are no moving parts to wear out.

The result is a solution that is highly shock-proof, while featuring low power consumption and an exceptional degree of integration flexibility into the finished product.

The infrared technology consists of a multi-spectral detector that operates according to the principles of absorption measuring and ray mixture. During each use, the infrared light is reflected in four directions after which it passes through a filter. The filters are laid out so that they are only permeable for a small wave length bandwidth in which the analyzed gas shows a particular absorption characteristic. Consequently, it is possible to determine the concentration of the gas, based on the light intensity measured by a sensor. And unlike other sensors, the AAM is not susceptible to cross-sensitivities due to gases like water vapour, ethanol or acetone.

A rapid response time of less than 350 ms for CO_2 and less than 500 ms for other gases enables the AAM to differentiate between inhaled and exhaled gas concentrations. Plus, the functional range of the AAM provides automatic identification of the agent, including identifying and quantifying a mixture of two different anesthetic gases. Yet both sensors are lifetime calibrated and require only minimal maintenance.

WaterLock - the advanced water trap from Dräger Medical protects your gas measuring equipment against infiltration water, bacteria and viruses. This user friendly product improves the longevity and accuracy of your devices. The WaterLock has a guaranteed operating life of four weeks and can be reused as often as needed during this time.

For hygienic draining, all you need to do is remove the water trap from its mounting, insert a commercial syringe and extract the water. The WaterLock owes its high efficiency to two hydrophobic Goretex-membranes made of PTFE. These micro-porous filters have a pore size of only $0.2\mu m$, which is impermeable to condensed water and contaminants. Yet it allows the measured gas to pass through without a noteworthy decrease in pressure. The design of the filter housing creates a self-purification effect that helps prevent clogging.

Furthermore, the system has been constructed to optimize top-level accuracy for real-time curves and render impossible overflows of the water trap tank.

Warning:

- Always test sampling line adapter for a tight connection and proper operation before attaching to a patient.
- ♦ Sevoflurane is an investigative drug and can only be used on humans where authorized by governing agencies within the individual countries.
- The outputs of the two oscillators are mixed and filtered to produce a signal that is the difference in frequency of the two. The difference frequency is used to calculate the concentration of the selected gas.
- The response for agent detection depends on the response time of the detector and the sample flow rate. At a flow rate of 140 ml/min., the response time is adequate for breath rates up to eighteen (18) breaths per minute. For breath rates over this, performance may be affected.
- Since the sensitivity of the gas detector is different for each gas, it is necessary to select which gas is being administered.

Note:

Patient Waste Gas Removal:

Continuous exposure of Health Care workers to waste anesthetic gases (including halogenated agents and nitrous oxide) is not recommended. Always attach both waste gas connections on the rear of the monitor to the room's gas evacuation system. Avoid venting any waste anesthetic gas directly into the room air as exposure to waste anesthetic gases above the recommended OHSA limits could result.

PATIENT CONNECTIONS

Use only original Schiller America Inc. sampling lines and accessories; other sampling lines may cause inaccurate readings and malfunctions. Change sampling line and airway adapter for each patient.

Complete the patient connections following the below steps:

- 1. Select the suitable Water Trap Cartridge/Adapter and install the fixed seat on the side of the Patient Monitor.
- 2. Connect the sample line with the water trap adapter.
- 3. Connect the sample's other end with the patient via airway adapter.
- 4. Connect Endotracheal Tube with an anesthesia or ventilator circuit with a side stream outlet.

ANESTHETIC AGENT DISPLAY

DISPLAY

Open the DRAGER Gas module and then choose to display Gas waveform in the "Waveform Select" menu. See graph below.

SENSOR STATUS

- Sensor Off
- Check Watertrap/Sample Line
- Hardware Failure
- Occlusion
- Zero in Progress
- Sensor Standby (See the menu setup below)
- Sensor Warm Up

The Zero Procedure has the purpose to maintain proper accuracy of the measurements.

Zero requests typically occur after the warm-up phase (a couple of minutes or so after start-up) of a sensor component and then again in regular time intervals (every two hours). Under certain circumstances the module will indicate extraordinary zero requests (e.g. after returning from Standby Mode or Switched Off mode). Most AAM have an internal zero management that schedules the regular zero requests in an intelligent way, such that zero requests for several individual parameters are synchronized with each other. By this, zero requests will occur less frequent, and also the zeroing process can be conducted for several gas parameters at the same time. As a consequence, zeroing will consume less of the operation time and the availability of measured data is improved.

The time needed for conducting a Zero Procedure varies between different sensor heads. Typically, it will require between ca. 20 seconds and 1 minute. In the course of the Zero Procedure, the setting of the valve and the pump change temporarily. When the Zero Procedure is finished, the module will automatically restore the valve and pump settings prior to the procedure.

PHYSIOLOGIC AGENT STATUS

ID: The AAM has identified an agent. In this state, the corresponding ID indicates one of the 5 anesthetic agents.

CALC: Calculate..., The Patient Gas Module is currently busy with identifying the present agent(s). This status typically lasts for a couple of seconds.

"Calculate" is a condition in which the agent mixture algorithm is not sure about the detected agents. Usually it comes up if no single agent history is available and a mixture situation occurs. Then it may stay for a few seconds.

OVER: Overflow

The gas concentration has increased above the maximum threshold.

MIX: Mixture

The Patient Gas Module can not identify the present agent(s). The reason is the presence of

- Either a mixture of too many anesthetic agents

- or other unidentifiable gases

FORCE:

Forced mode is used for the non-automatic Identification.

These sensors are not able to identify which of the volatile anesthetic agents Halothane, Enflurane, Isoflurane, Sevoflurane or Desflurane is contained within the patient gas. This type of sensor is always operated in "Forced Mode".

In this mode the monitor will specify the type of anesthetic agent for the AAM with the command "Select Anesthetic Agent". The ID of the Physiologic Agent then reflects the forced agent.

EST: Estimated

The AAM can not identify the present agent(s) but only give an estimation of one of the present agents. The reason is the presence of

- Either a mixture of too many anesthetic agents
- Or other unidentifiable gases

ANESTHETIC AGENT TYPE

- HAL Halothane
- ENF Enflurane
- ISO Isoflurane
- SEV Sevoflurane
- DES Desflurane

ANESTHETIC AGENT SETUP

Touch the Anesthetic Agent Waveform or Parameter Area to pop up the menu of Multi-Gas Setup, see below

Figure 28: Tree Diagram for Multi-Gas Waveform Setup Menu

ALARM SWITCH

ON and OFF for choice, the factory-set is ON. When the choice is ON, the alarm is activated; when the choice is **OFF**, the alarm indicator will not light, the relative alarm

parameter will not flash and relative parameter area will appear an icon of \Im .

APNEA DELAY

This setting is used to set the no breaths detected time-out. This time-out is the time period in seconds following the last detected breath at which the CO_2 module will signal no breaths detected.

The setting range is $10 \sim 60$ seconds, and the factory-set is 10 seconds.

AGENT TYPE

"Auto ID", "Halothane", "Enflurane", "Isoflurane", "Sevoflurane" and "Desflurane" for choice.

If the AAM has no "Auto ID" function, the anesthetic agent type needs to be selected manually.

WAVEFORM SCALE

"0-10%" and "0-20%" for choice, the factory-set is "0-10%". Use this setting to adjust the amplitude measurement (size) of the displayed $EtCO_2$ waveform scale manually.

WAVE FILL

Use this setting to fill in the bottom portion of the waveform on any channel of the display.

SWEEP SPEED

12.5mm/s and 25mm/s for choice, the factory-set is 12.5mm/s.

SWEEO COLOR

It provides white, red, green, cyan, blue, yellow, gray and magenta which can be chosen.

GAS UNIT SETUP

"mmHg", "kPa" and "%" for choice, the factory-set is %

ALARM SETUP

	High	Low		
FI Agt	0.0-20.0 factory-set: 5.0(%)	0.0-20.0 factory-set: 0.0(%)		
ET Agt	0.0-20.0 factory-set: 5.0(%)	0.0-20.0 factory-set: 0.0(%)

RR	0-100 factory-set: 30(rpm)	0-100 factory-set: 5 (rpm)		
FI N2O	0-100 factory-set: 100(%)	0-100 factory-set: 0(%)		
ET N2O	0-100 factory-set: 100(%)	0-100 factory-set: 0(%)		
FI O2	18-100 factory-set: 100(%)	18-100 factory-set: 18(%)		
ET O2	0-100 factory-set: 100(%)	0-100 factory-set: 5(%)		

ADVANCED SETUP

ZERO GAS TYPE

"Scrubbed Air/N₂/O₂", "Room Air" and "100% O₂" for choice, the factory-set is "Room Air".

O2 COMPENSATIONS

The anesthetic agents in the gas mixture need to be compensated in order to achieve its stated accuracy. The instrument settings for this parameter should be set when the O_2 sensor is unconnected. But when install the O_2 sensor, this function isn't available.

STANDBY MODE

When measurements are temporarily not needed, the monitor can switch the AAM from 'Operation Mode' into 'Standby Mode'. During standby, some internal components of the module are switched off, which increases the lifetime of the module. When measurements are needed again, the device must be switched back into 'Operation Mode'. The latter transition will usually take less than 30 seconds.

MAC (Minimum Alveolar Concentration) Calculation

The MAC value may be calculated and displayed by using end-tidal (ET) gas concentrations according to the following formula:

MAC =
$$\frac{\% ET(AA1)}{X(AA1)} + \frac{\% ET(AA2)}{X(AA2)} + \frac{\% ET(N_2O)}{100}$$

X (AA): HAL=0.75%, ENF=1.7%, ISO=1.15%, SEV=0.25%, DES=6.0%

[NOTE]: The altitude and the patient age as well as other individual factors are not taken into account in the above described formula. ET gas concentrations for secondary agent (AA2) is only available for IRMA AX+/OR+ probes.

CALIBRATION

The gas module doesn't require calibration.

The gas module is calibrated once in the factory during production and this calibration is valid for the complete lifetime of the module. During operation, to compensate for drifts, the module will request a Zeroing Procedure in regular intervals. After a zeroing command from the host the module conducts the Zero Procedure automatically.

PATIENT INFORMATION ADMINISTRATION

- PATIENT BASIC INFORMATION SETUP
- ADD NEW PATIENT
- DELETE PATIENT

PATIENT BASIC INFORMATION SETUP

When you start the monitor, it will pop up a countdown window to remind you to set the patient information. If you choose YES, you can set patient information directly.

Also you can set by touching the patient ID area at the top left corner to pop up patient setup menu. You can have settings as below:

Figure 29: Tree Diagram for Patient Setup

ID

Set the ID number of patient. The ID number for each patient is different and unique.

[NOTE]: If you set the same ID with previous patient, the measurement data record will be saved following after the previous data with same ID.

NAME

The input character range is: uppercase, A-Z, point (.) and blank character. Patient name support the display method of English, and do not support the Chinese character input. The user can input 9 characters at most.

SEX

Set the patient gender, the default setting is **MALE**.

BLOOD

Set the blood type of patient. It can be: N/A(unknown type), A, B, O, AB, RH+, RHand so on, the default setting is N/A.

AGE

Set the age of patient. The range is $0 \sim 120$, the default setting is **20**.

[NOTE]

The Patient Monitor displays physiological data and stores them in the trends as soon as a patient is connected. This allows you to monitor a patient that is not saved information yet. However, it is recommended that you fully admit a patient so that you can clearly identify your patient, on recordings, reports and networking devices.

[NOTE]

Once the user chooses the method of **YES** to exit from the Patient Information Setup, all information of patient will be refreshed and the trend data will be renovated.

ADD NEW PATIENT

If you want to change other patient, you should input new patient information first. You have two ways to achieve it.

- 1. Touch the Patient ID area directly.
- 2. Touch the "Pause" soft-key and then choose "Start new case".

DELETE PATIENT

The monitor can save eight groups patient information for recall. You can delete the previous patient in order to add new.

Pop up the "Recall" Menu, enter into "Delete the patient" menu and choose one as you required.

TREND

- TREND OBSERVATION
- TIME SETUP
- MARK EVENT SETUP
- TREND TIME
- TREND GRAPH ANALYSIS
- TABULAR TREND ANALYSIS
- ALARM EVENT
- LAST WAVEFORM

TREND OBSERVATION

Monitoring system will save and trace the trend of parameters below: Heart Rate (HR), Oxygen Saturation (SpO₂) Noninvasive Blood Pressure (SYS, DIA, Mean Blood Pressure) Temperature(Temp) Pulse Rate (PR) Respiration Rate (RR) End-tidal Carbon Dioxide (EtCO₂) Invasive Blood Pressure (IBP1, IBP2) EVENT

Press the function button of **TREND** button to pop up the graph below:

				Trend Ha	nagement						
	Trend Time:	30	Mins (
	Graphical Trem	nd >>		Start Time:	1/1//20	14 16:06:0)1				
	Tabular Trend	>>		Save Time:	1/17/20	14 16:14:0	17				
	Alarm Event	>>		Event List	>>>						
	Last Waveform	>>		🖥 Exit							
							Ĩ				
NIBP List	Alarm Setup	•> Mark Event	Start/Stop	Silence	Setup	Freeze	Trend	Fint	<⇒> Recall	Pause Pause	

Data-recording Status Bar:

It is used to show the current data-recording length. For example, the user set a trend of 15 minutes, if the color of bar right moment is red, it means that the data-recording time is shorter than 15 minutes, i.e. the data-recording length is smaller than the time-length choosing by user; if the color is light-blue, it means that the data-recording is equal to the choosing time-length; if the bar presents the light-blue and green alternately, it means that the data-recording length is larger than the setup time length, and the light-blue part is the proportion of data-recording length covered by the time-length, and the green part is the proportion of data-recording length covered by time-length which has not been chosen.

TIME SETUP

In order to review data easily and intuitively, you should have set a right time. Touch the time area at the top right corner to pop up time setup menu. You can have settings as below:

Figure 30: Tree Diagram for Time Setup

The value of year, month, day, hour and minute can be set, also you can set the Time Mode to 12h or 24h. system will amend the internal clock according to the new settings.

Once the system time realigned, the trend data will renew correspondingly. On entering the master screen, please checks whether the monitor time and the current time are consistent, if not, please correct them.

MARK EVENT SETUP

During the patient monitoring, some event occurred will influence the patient and lead to the waveforms or parameters change. In order to analysis the effect, you can mark the event for recall.

There are four types of events that you can define. You can freely define the implication of each type.

The menu is like the chart below:

	Mark Event	
Mark Event A	Mark Event B	
Mark Event C	Mark Event D	
		V Yes
		×No

Figure 31: Window for Mark Event Setup

MARK EVENT

Choose the related event item as you want from A, B, C and D. There is a V mark signal for the ones selected

Choose the method of **YES** to exit, and the event marked is become effective immediately upon the exit, or else it will not become effective.

When an event occurs, all the measurement numeric at the event trigger time is stored.

The Event can be recall from Event list in the Trend. See chart below:

					Event L	st				
D.	Ivent	Tine	NTEP	SP02	HR	78	RESP	TI	12	ST

		PageUp	Page	Down	Print		Clear		Close	

Figure 32: Window for Event List

IMPORTANCE OF EVENT MARKING:

It can classify the circumstances which influence the parameter monitoring on patient, for example, medicine taking, injection and other treatment, These events, displaying on trend graph and table, are very important to the parameter analysis.

TREND TIME

Trend time is the time length before current time.

There are twelve items for trend time choosing: 30 minutes, 60 minutes, 90 minutes, 3 hours, 6 hours, 12 hours, 18 hours, 24 hours, 36 hours, 48 hours, 60 hours, 72 hours. For instance, if 30 minutes is chose as the reference trend time, then we can recall the trend change of 30 minutes before current time.

TREND TIME INTERVAL

Trend Time Interval means how often the system stores a trend data. Different trend reference time has its correlated trend time interval, the relation between them are show below:

Time	Time Interval
30 minutes	6 seconds
60 minutes	12 seconds
90 minutes	18 seconds
3 hours	36 seconds
6 hours	72 seconds
12 hours	144 seconds
18 hours	216 seconds
24 hours	288 seconds
36 hours	432 seconds
48 hours	576 seconds
60 hours	720 seconds
72 hours	864 seconds

TREND GRAPH ANALYSIS

TREND GRAPH ADMITTANCE

Press the "Trend Graph" button to pop up the Graphical Trend window.

Figure 33: Window for Trend Graph

Each page display the trend chart of one parameter, the user can change them by choosing **PARAMETER**, and the order is as below:

HR, SpO₂, RESP, NIBP, ST, PR, TEMP, inAgt, expAgt, inN2O, EtCO₂, IBP1, IBP2.

The newest data is on the right side of the graph, time is displaying on the bottom of the graph at the scale-of-24 hours, the upper and lower limit of parameter is displaying on the left side of graph.

CURSOR BAR

It is the red vertical line on the trend graph for indication. The parameters' values in the graph are gotten at the time the red vertical line indicates.

Press the "Shift Left" or "Shift Right" button. You will move the red cursor bar left or right until it is at the position as required.

TABULAR TREND ANALYSIS

TREND TABLE ADMITTANCE

Press the "Tabular Trend" button to pop up the Tabular Trend window. The trend Table menu will display in the waveform area on the screen.

Sixteen groups of parameters are listed every one page and three hundred groups in total. These data will be listed follow the order of from new to former and the time is displaying at the scale-of-24 hours. The parameter name is display on the top of chart and the invalid data will not display.

BASIC TABULAR TREND

Figure 34: Window for Basic Parameters Tabular Trend

IBP TABULAR TREND

Figure 35: Window for IBP Tabular Trend

TREND TABLE MOVING

Press the "PageUp", "PageDown", "Print", "Clear" button to complete relevant operation. If the "Clear" be choosing, the data all saved in the trend will be deleted.

TRANSFERRING TRENDS VIA RS-232

The entire trend memory can be transferred to an external computer via the RS-232 interface. Refer to the RS-232 INTERFACE section for details.

ALARM EVENT

In this window, you can recall the alarm information. It includes the parameter's waveform and value exceeds the limits.

In this window you can select the alarm parameter (10 parameters), alarm waveform (12 waveforms) and alarm times (8 times).

Figure 36: Window for Alarm Event Review

LAST WAVEFORM

Press "Last Waveform" button to pop up the last waveform review window like the graph below:

Figure 37: Window for Last Waveform Review

When there are waveforms display for demonstration or real-time measurement, the system only save data for the last 16 seconds and display two selectable waveforms, the happened time for the late waveforms will display on the title bar in the window.

CALCULATION

- INTRODUCTION
- DRUG CALCULATION
- HEMODYNAMIC CALCULATION

INTRODUCTION

The calculation feature is available with your Patient Monitor. The calculated values, which are not directly measured, are computed based on the values you input.

TRANQUILITY II Patient Monitor can mainly perform calculations: Drug calculation, Hemodynamic calculation.

[NOTE]: The calculation feature is independent of other monitoring functions and can be therefore used for patients being monitored by other monitors. Any operation in a calculation window does not affect the monitoring for patients.

DRUG CALCULATION

HOW TO OPERATE

- 1. Select "System Setup" --- \rightarrow "Drug Calculation" menu. The interface is as Figure 45:
- Select the appropriate settings. The drug calculation program has a library of commonly used drugs, of which drug A through drug E are for those not specified in this library.

The drugs are as follows: Aminophylline, Dobutamine, Dopamine, Epinephrine, Heparin, Isuprel, Lidocaine, Nipride, Nitroglycerin, Pitocin, drug A, B, C, D, E.

The user must enter values following the doctor's instructions, and then the calculated value can only be used.

Figure 38: Window for Drug Calculation

DRAG UNIT

Each drug has its fixed unit or unit series. Among a unit series, one unit may change to another automatically depending on the entered value.

The units for each drug are as follows:

- Drug A, B, C, Aminophylline, Dobutamin, Dopamine, Epinephrine, Isuprel, Lidocaine, Nipride and Nitroglycerin use the unit series: g, mg and mcg.
- Drug D, Heparin and Pitocin use the unit series: unit, KU (kilo units) and MU (million units).
- Drug E uses the unit: mEg (milli-equivalents).

You must select the proper drug name (A, B, C, D or E) according to the units when you define a drug not listed this library.

TITRATION TABLE

Select "Titration Table" in the "Drug Calculation" window after the drug calculation is finished.

In the titration table, when you change "Reference", "Interval", "Dose Type", the titrated value will change accordingly.

Select "Print" item to print out the currently displayed titrated values by the printer.

HEMODYNAMIC CALCULATION

Hemodynamic, meaning literally "Blood flow, motion and equilibrium under the action of external forces", is the study of blood flow or the circulation. It explains the physical laws that govern the flow of blood in the blood vessels.

Hemodynamic calculation has an important meaning for clinical guidance.

HOW TO OPERATE

- 1. Select "System Setup" ---→"Hemodynamic Cal" menu. The interface is as Figure 46:
- 2. Confirm you have input correct values.
- 3. Select the "Calculation" button. The system performs a calculation per the current settings and displays the calculated values.
 - If a calculated value is outside the range, its background will highlight in yellow.
 - You can press the "Reference Range" button to view its normal range in the unit field.
 - Invalid values are displayed as "---".
- 4. Press the "Print" button; the currently displayed calculations are printed out by the printer.
- 5. Review the previously performed calculations by selecting "Calculation Review". Review the input data by selecting "Check Input".

RECALL DATA

- RECALL DATA STORAGE
- RECALL DATA DISPLAYS
- RECALL OPERATION DESCRIPTIONS

RECALL DATA STORAGE

Recall Data in graphical or tabular format can be displayed on the screen or transferred to on the computer for analysis via RS232 interface, and printed if a printer is installed.

The recall data for all parameters is the average of a 6-second sample of the data. Seventy two (72) hours of recall data is stored in a nonvolatile memory, and remain in storage when the monitor is in Standby.

A new print of recall data is started each time the monitor is turned on. A recall data record is defined as the data from one power on event to the Standby power event. A date/time annotation is included at the start of each new print (up to eight patients') and the print can be correlated with the patient. Once the recall memory has stored 72 hours of data, the oldest recall data will be overwritten by new data.

RECALL DATA DISPLAY

The Recall data are displayed in graphical or tabular format. The recall information in graphical format for a selected parameter is shown as a line connecting each of the points representing the stored 6-second average.

The information stored for each recall episode can include:

- Numeric vital signs for all the measurements monitored
- Waveforms for up to 12 measurements of alarm events for your choice

You can navigate through the recall database to view events retrospectively, and you can document recalls on a recording or report marked with the patient name, patient ID, the data and time.

RECALL OPERATION DESCRIPTION

1. You should input ID and name of a patient first for recall

After you power on the monitor, there is a window pop out on the screen to remind you input the patient's ID as following:

Figure 40: Window for Indication Information

The above window will be automatically closed in count down 10 seconds.

- 2. Press the "Recall" soft-key to open the recall function for up to 8 patients
- 3. Select the patient's ID for recall

	Recall Patient History Data	
ID: 001	ID: 002 Name: TOM	
ID: 003 Name: LUCY	ID: 004 Name: SUNDY

Figure 42: Window for Trend Management with ID

[NOTE]

This trend management-default window is for a patient which has no ID number. The introduction of trend data recall refers to chapter TREND.

RS-232 INTERFACE

- OVERVIEW
- CABLE CONNECTION
- EXPORTING TREND DATA

OVERVIEW

Patient data can be obtained through the RS-232 I/O connector on the rear panel of the monitor by connecting it to an attached PC.

CAUTION: DO NOT download patient data when the monitor is monitoring a patient. This may cause the monitor to lock up.

CABLE CONNECTION

The 9-pin connector mounted on the rear panel provides an access port for a serial (RS-232) interface to a suitably configured personal computer. Its pins layout is seen as following picture:

RS-232 Serial Interface Connections:

Pin #	Signal	Definition
1	not used	
2	TXD	Transmit Data
3	RXD	Received Data
4	not used	
5	GND	Signal Ground
6	not used	
7	not used	
8	not used	
9	+5V	Power Supply

EXPORTING TREND DATA

In order to download trend data from the TRANQUILITY II, communication software should be installed in the external computer. The transfer protocol should be set as follows:

Baud Rate: 19,200 Data Bits: 8 Start Bit: 1 Stop Bits: 1 Odd Parity: 1

Connect the TRANQUILITY II to the serial port of the computer using a cable. Start the communication program on the computer and export trend data from the TRANQUILITY II.

PRINTER (OPTION)

- PRINTET SETUP
- PRINT REAL-TIME WAVEFORM
- PRINT TABULAR TREND
- GRID OUTPUT
- PRINT ALARM EVENT
- PRINT EVENT LIST
- PRINT EXPLATION
- WAVEFORM PRINT EXPLARION

PRINTER SETUP

Please refer to chapter SYSTEM SETUP for details.

[NOTE]: This is thermal printer which must use the thermal printer paper (the specification is 48 mm on width).

PRINT REAL-TIME WAVEFORM

Press the "Print" soft-key, the statement of "Printing Started" appears on the bottom of screen, which shows that the print process is going on. If you want to terminate print during the printing process, just press the "Print" soft-key again. The printer stop immediately as the statement of "Printing Stopped" will appears on the bottom of screen.

Form the preceding 8 seconds before the printing. It can print a burst of two or three waveforms.

The print contents also include Patient Name, Hospital name, Print Time, HR, ST, RESP, SpO₂, NIBP (SYS, DIA,) T1, T2, EtCO₂, IBP1, IBP2 and so on. See graph below:

Figure 43: Real-time Waveform Print

PRINT TABULAR TREND

Not only can you print the basic parameter trend table, but also other special table as IBP Tabular, EtCO2 Tabular and so on.

[NOTE]: The special tabular is enabled when the relevant module is opened.

			1.0.00	17:07:06	17:07:00	17:06:54	17:06:48	17:06:42	NAME :

Figure 44: Basic Tabular Trend Print

GRID OUTPUT

Some printer paper without grid, in order to observe the waveform easily, you can set the grid form. The set method refers to Chapter SYSTEM SETUP.

When the Grid Output is set to ON (default value is OFF), then the parameters being printed are in the grid form.

PRINT ALARM EVENT

When a parameter value violates the range limits, you can recheck the alarm trend through press "Trend" soft-key and then choose "Alarm Event". In the Alarm trend menu, you can choose the "Print" item to record the alarm information.

One paper of alarm report, includes Patient Name, Alarm Message, Alarm Happened Time, waveform if the parameter has and parameter's numeric.

Figure 45: Alarm Event Print

If the alarm print is set to ON, It can print a slip of waveform of 10 seconds (the preceding 4 seconds before the printing till the current 4 seconds) when an alarm is happened.

```
[NOTE]: "-----" means invalid parameter.
```

PRINT EVENT LIST

Print out the event list for review.

Event	Ð	В	D	D	D	A	-	and the second	NAME:
Time	16:10:45	16:10:39	16:10:27	16:10:21	16:10:15	16:10:09	00:00:00	00:00:00	2014/01/20 16:11:0.
NIEP (mmHg)	120/80	120/80	120/80	120/80	120/80	120/80			Event List

Figure 46: Event List Print

PRINT EXPLANTION

INSERTING PAPER

Press the button of the catch on the printer, open the catch and take the old paper roll out and insert a new one into the paper cassette. Pay attention that the paper is turning swiftly. Pull a small length of paper out of the catch from the lower end of the roll (If it is the upper end, the paper reel installed conversely), close the catch, and make sure that the paper is just in the groove, or else paper advance will not be orderly.

ATTENTIONS

- The time of continuous print cannot exceed 2 minutes.
- DO NOT press the button of print when there is no paper, or the printer head will be damaged.
- Only thermal printer paper can be used.
- If there is too much dust, use a sponge lightly moistened with alcohol to clean the correlated parts.

INDICATING MESSAGES

Message	Meaning
Start printing	Printing process is going on.
Break printing!	The button of print been pressed again
	during the process of printing, so it can
	press the button once again to re-start it
Printer Door Open	Printer's door has been opened
Printer Door Close	Printer's door has been closed
Printer Paper Ok	Showing that printer paper has been
	installed well
Printer No Paper	Printer paper has been used up
Printer UnLink!	Printer has not been connected to monitor.
Print Not Ready	Printer hasn't been connected well

WAVEFORM PRINT EXPLANATION

Paper Advance Speed: 25mm/s Scale Specification: x0.5 exp ×0.5 expresses 1mV/3.25mm ×1 expresses 1mV/6.5mm x2 expresses 1mV/13mm

BATTERY OPERATION

INTRODUCTION

TRANQUILITY II Patient Monitor is designed to operate on one XHP5Ah rechargeable Lithium ion battery whenever AC power supply is interrupted. The battery is charged whenever the patient monitor is connected to an AC power source regardless of whether or not the patient monitor is currently on.

A new, fully charged battery will provide about 2 hour of monitoring time under the following conditions: no audible alarms, no analog or serial output devices attached, and no backlight. The charge and discharge cycles life of the battery is about 300 times.

When the battery is being charged, the DC Led is ON; a symbol dynamic will be displayed in the upper right quarter of the screen to indicate the status of recharging. Until it is full, the symbol changes to static. When the monitor is powered by the battery, the DC Led will flicker and a symbol which represents the electric energy of the battery will be displayed in the upper right quarter of the screen.

When operating on battery, the monitor will prompt alarm and shut off automatically when the electric energy is low. When the electric energy is lower than 25 % of total power capacity, the alarm will be active, at the same time the message of "Battery Power Low" will display in the message area in the top of screen. The battery symbol will change to empty.

Connect the monitor to AC power at this moment can recharge the battery while operating. If keep operating on the battery, the monitor will shut off automatically upon exhaustion of the battery.

[NOTE]: Whenever the monitor is connected to AC power, the battery is being charged. Therefore, it is recommended that the monitor remain connected to AC power when not in use. This will make available a fully charged battery for use at any time.

[NOTE]: As the battery is used and recharged over a period of time, the amount of time between the onset of the low battery alarm and the instrument shut-off may become shorter.

If the backlight is turned off during a low battery condition, it cannot be turned back on. It is recommended that the internal battery is replaced by qualified service personnel every 24 months.

[CAUTION]: If the TRANQUILITY II is to be stored for a period of 2 months or longer, notify service personnel to remove the battery from the monitor prior to storage. Recharge the battery when it has not been charged for 2 or more months.

BATTERY RECYCLE

When a battery has visual signs of damage, or no longer holds a charge, it should be replaced. Remove the old battery from the Patient Monitor and recycle it properly. To dispose of a battery, follow local laws for proper disposal.

[WARNING]: DO NOT disassemble batteries, or put them into fire, or cause them to short circuit. They may ignite, explode, or leak, causing personal injury.

DISPOSAL OF DEVICE COMPONENTS

Follow local governing ordinances and recycling instructions regarding disposal or recycling of device components, including batteries.

PERIODIC SAFETY CHECKS

It is recommended that the following checks be performed every 24 months.

- Inspect the equipment for mechanical and functional damage.
- Inspect the safety relevant labels for legibility.

WARNING: DO NOT spray, pour, or spill liquid on TRANQUILITY II, its accessories, connectors, switches, or openings in the chassis. DO NOT immerse the TRANQUILITY II or its accessories in liquid or clean with caustic or abrasive

CLEANING

To clean the TRANQUILITY II, dampen a cloth with a commercial, nonabrasive cleaner and wipe the exterior surfaces lightly. Do not allow any liquids to come in contact with the power connector or switches. Do not allow any liquids to penetrate connectors or openings in the instrument. For cables, sensors, and cuffs, follow the cleaning instructions in the directions for use that accompany these accessories.

SPECIFICATIONS

SAFETY			
Meet the requirement of EN60601 series, CE marking according to MDD93/42/EEC			
Equipment not suitable for use in the presence of a flammable anesthetic mixture with ai			
or with oxygen or nitrous oxide			
Type of Protection:	Class I (on AC power)		
.,,,,,,,,,,,,,,,,,,,,,,,,,,,,,,,,,,,,,,	Internally powered (on battery power)

Pace Pulse Markers:	Pace pulses meeting the following conditions are labelled with a PACE marker:		
	Signal Amplitude: $\pm 10 \text{ mV} \sim \pm 700 \text{ mV}$		
	Pulse Width: 0.1 ms \sim 2 ms		
	Signal Rising and Falling Time:10 μ s \sim 100 μ s		
Pace Pulse Rejection:	When tested in accordance with the ANSI/AAMI		
Face Fuise Rejection.	EC13-2002: Sections 4.1.4.1 and 4.1.4.3, the		
	heart rate meter rejects all pulses meeting the		
	following conditions.		
	Signal Amplitude: ±2 mV~±700 mV		
	Pulse Width:0.1ms~2 ms		
	Signal Rising and Falling Time:10 $\ \mu$ s \sim 100 $\ \mu$ s		
RESP			
Measure Method:	RA-LL Impedance		
Lead:	Lead II		
Respiration Excitation Waveform:	<300 μ A, sinusoid, 62.5 kHz (±10%)		
Range:	0~120 rpm		
Accuracy:	±3 rpm		
Alarm Limit:	Upper Limit: 8~120 rpm		
	Lower Limit: 6~100 rpm		
Sweep Speed:	6.25, 12.5 and 25 mm/s		
Gain Choice:	x0.25, x0.5, x1.0, x2.0		
Respiration Impedance Range:	0.3 Ω~ 5 Ω		
Baseline Impedance Range:	$200\Omega{\sim}2500\Omega$ (using an ECG cable with		
	1k Ω resistance)		
SpO2			
Standard:	ISO 9919		
ASpO2:	Anti-motion SpO2		
Measuring Technology:	Light absorption method		
SpO ₂ Measurement Range:	0~100 %		
SpO ₂ Accuracy:	$70 \sim 100$ %: ±2 %		
	0~69 % : Undefined		
PR Measurement Range:	30~250 bpm		
PR Accuracy:	±2 bpm(non-motion)		
SpO ₂ Alarm Limit:	±3 bpm (motion)		
	Upper Limit : 50 \sim 99 %, Lower Limit : 50 \sim 99 %		
SpO ₂ Probe:	Red Light LED Wavelength: 660±5 nm		
	Infrared Light LED Wavelength: 940±10 nm		
Option Type:	Masimo, Nellcor		
1 - 71 -	(See their modules' relative technical		
	specifications)		
Refreshing Rate:	1 s		
NIBP			
Measuring Technology:	Automatic Oscillating Measurement		
Cuff Inflating:	$<30 \text{ s}$ (0 \sim 300 mmHg, Standard Adult Cuff)		
Measuring Period :	AVE < 40 s		
Mode:	Manual, Auto, STAT		
Measuring Interval In AUTO Mode:	2 minutes~4 hours		
Pulse Rate Range:	30 bpm~250 bpm		
Measuring Range:	Adult/Pediatric Mode		
	SYS 40~250 (mmHg)		
	DIA 15~200 (mmHg)		

	Neonatal Mode		
	SYS 40~135 (mmHg)		
	DIA 15~100 (mmHg)		
Resolution:	1mmHg		
Pressure Accuracy:	Maximum Mean Error: ±5mmHg		
	Maximum Standard Deviation: 8mmHg		
Overpressure Protection:	Adult Mode : 280(mmHg)		
	Neonatal Mode : 150 (mmHg)		
Alarm Limit:	SYS(Upper/Lower): 30~240 mmHg		
	DIA (Upper/Lower) : 15~180 mmHg		
TEMP			
Standards:	EN 12470-4		
Measuring Technology:	Thermal Resistance		
Scale:	Selectable °C or °F		
Channel:	2 channels		
Range:	T1 and T2 : 25℃~50℃/77 °F~122 °F		
	Delta T: 0°C∼5.5°C/0°F∼9.9°F		
Accuracy:	±0.2℃(25.0℃~34.9℃)/(77°F~94.8°F)		
	±0.1℃(35.0℃~39.9℃) / (95°F~103.8°F)		
	±0.2℃(40.0℃~44.9℃) / (104°F~112.8°F)		
	±0.3℃(45.0℃~50.0℃) / (113°F~122°F)		
Display Resolution:	0.1℃(0.2°F)		
Alarm Limit:	Upper Limit: 10℃~50℃/50°F~122 °F		
	Lower Limit: 10℃~50℃/50 °F~122°F		
Transducer Sites:	ART, PA,CVP, RAP, LAP, ICP

EMC

The product is in radio-interference protection class A in accordance with EN55011. The product complies with the requirement of standard EN60601-1-2:2007 "Electromagnetic Compatibility - Medical Electrical Equipment".

ELECTROMAGNETIC IMMUNITY

This section constitutes the guidance and TRANQUILITY II Patient Monitor's declaration regarding electromagnetic immunity. The TRANQUILITY II Patient Monitor is intended for use in the electromagnetic environment specified below. The customer or the user of the TRANQUILITY II Patient Monitor should assure that it is used in such an environment.

Immunity test	IEC 60601 test level	Compliance level	Electromagnetic environment – guidance
Electrostatic discharge (ESD) IEC 61000-4-2	□6 kV contact □8 kV air	□6 kV contact □ 8 kV air	Floors should be wood, concrete or ceramic tile. If floors are covered with synthetic material, the relative humidity should be at least 30%.
Electrical fast transient/burst IEC 61000-4-4	2 kV for power supply lines 1 kV for input / output lines	□2 kV for power supply lines 1 kV for input / output lines	Mains power quality should be that of a typical commercial or hospital environment.
Surge IEC 61000-4-5	□1 kV differential Mode □2 kV differential Mode	differential Mode	Mains power quality should be that of a typical commercial or hospital environment.
Voltage dips, short interruptions and voltage variations on power supply input lines IEC 61000-4-11	<5 % UT1 (>95 % dip in UT) for 0.5 cycle 40 % UT (60 % dip in UT) for 5 cycles 70 % UT (30 % dip in UT) for 25 cycles <5 % UT (>95 % dip in UT) for 5 sec	UT) for 0.5 cycle 40 % UT (60 % dip in UT)	Mains power quality should be that of a typical commercial or hospital environment. If the user of the TRANQUILITY II Patient Monitor requires continued operation during power mains interruptions. it is recommended that the TRANQUILITY II Patient Monitor be powered from an uninterruptible power supply or a battery.
Power frequency (50/60 Hz)	3 A/m		Power frequency magnetic fields should be at levels characteristic of a typical

Note: U_{T} is the a. c. mains voltage prior to application of the test level.

Immunity test	IEC 60601 test level	Compliance level	Electromagnetic environment – guidance
magnetic field IEC 61000-4-8		3 A/m	location in a typical commercial or hospital environment.
			Portable and mobile RF communications equipment should be used no closer to any part of the TRANQUILITY II Patient Monitor, including cables, than the recommended separation distance calculated from the equation applicable to the frequency of the transmitter.
			Recommended separation distance:
Conducted RF IEC 61000-4-6 Radiated RF IEC 61000-4-3	3 Vrms 150 kHz to 80 MHz 3 V/m 80%AM@2Hz	3 Vrms 3 V/m	$d = \left[\frac{3.5}{V_1}\right]\sqrt{P}$ $d = \left[\frac{3.5}{V_1}\right]\sqrt{P}$ 80 MHz to 800 MHz
	80 MHz to 2.5 GHz		
Only ISA CO2 is tested at 20 V/m	20 V/m 80%AM@1kH z 80 MHz to 2.5 GHz	20 V/m	$d = \left[\frac{7}{E_1}\right]\sqrt{P}$ 800 MHz to 2.5 GHz Where P is the maximum output power rating of the transmitter in watts (W) according to the transmitter manufacturer and d is the recommended separation distance in meters (m).
			Field strengths from fixed RF transmitters, as determined by an electromagnetic site survey, a should be less than the compliance level in each frequency range.b Interference may occur in the vicinity of equipment marked with the following symbol:

-	EC 60601 test Compl evel level	liance Electro	omagnetic environment ance
[NOTE 2]: These gu affected by absorpti a. Field strengths fr telephones and land cannot be predicted to fixed RF transmitters strength in the loca applicable RF complia verify normal operaton necessary, such as re b. Over the frequency	ion and reflection from rom fixed transmitters mobile radios, amateur heoretically with accuration , an electromagnetic st tion in which the TR ance level above, The tion. If abnormal perfection or relocating y range 150 kHz to 80	bly in all situations m structures, object s, such as base so ar radio, AM and FM acy. To assess the site survey should be ANQUILITY II Pa TRANQUILITY II Pa formance is obsert the TRANQUILITY MHz, field strength	s. Electromagnetic propagation is ects and people. stations for radio (cellular/cordless) A radio broadcast and TV broadcast electromagnetic environment due to be considered. If the measured field tient Monitor is used exceeds the atient Monitor should be observed to rved, additional measures may be Y II Patient Monitor. s should be less than 3V/m.

interference by maint equipment (transmitte according to the maxi Rated maximum output power of transmitter [W]	aining a minimum distance ers) and the TRANQUI imum output power of Separation distance 150 kHz to 80 MHz $d = \left[\frac{3.5}{V_1}\right]\sqrt{P}$	ance between porta LITY II Patient Mor the communication ace according to f 80 MHz to 8 $d = \left[\frac{3.5}{V_1}\right] \sqrt{2}$	able and mobile RF communications nitor as recommended below, s equipmentrequency of transmitter [m]00 MHz800 MHz to 2.5 GHz $d = \left[\frac{7}{E_1}\right]\sqrt{P}$
interference by maint equipment (transmitte according to the maxi Rated maximum output power of transmitter [W] 0.01 0.1	aining a minimum distance ers) and the TRANQUI imum output power of Separation distance 150 kHz to 80 MHz $d = \left[\frac{3.5}{V_1}\right]\sqrt{P}$ 0.12	ance between porta LITY II Patient Mor the communication ace according to f 80 MHz to 8 $d = \left[\frac{3.5}{V_1}\right]$ 0.12	able and mobile RF communications nitor as recommended below, s equipmentrequency of transmitter [m]00 MHz800 MHz to 2.5 GHz $d = \left[\frac{7}{E_1}\right]\sqrt{P}$ 0.23
interference by maint equipment (transmitte according to the maxi Rated maximum output power of transmitter [W] 0.01	aining a minimum distance ers) and the TRANQUI imum output power of Separation distance $d = \left[\frac{3.5}{V_1}\right]\sqrt{P}$ 0.12 0.38	ance between porta LITY II Patient Mor the communication ace according to f 80 MHz to 8 $d = \left[\frac{3.5}{V_1}\right]$ 0.12 0.38	able and mobile RF communications nitor as recommended below, s equipmentrequency of transmitter [m]00 MHz800 MHz to 2.5 GHz $d = \left[\frac{7}{E_1}\right]\sqrt{P}$ 0.230.23

For transmitters rated at a maximum output power not listed above, the recommended separation distance d in meters (m) can be estimated using the equation applicable to the frequency of the transmitter, where P is the maximum output power rating of the transmitter in watts (W) according to the transmitter manufacturer.

[NOTE 1]: At 80 MHz and 800 MHz, the separation distance for the higher frequency range applies.

[NOTE 2]: These guidelines may not apply in all situations. Electromagnetic propagation is affected by absorption and reflection from structures, objects and people.
